

GTT Protocol

For all variants of the GTT29A, GTT35A, GTT38A, GTT43A, GTT50A, and GTT70A

Protocol Manual

Revision 2.7.1

Firmware Revision: 2.13 or Higher

Revision History

Revision	Date	Description	Author
2.7.1	20 July, 2020	Updated Manual Update command 91	Malinis
2.7	December 19, 2018	Added commands for Firmware 2.13 release Included CRC and GTT25 information	Divino
2.6	8 December 2016	Added commands for Firmware 2.6 release	Divino
2.5	1 September 2016	Added Filled Slider and corrected Get Toggle State command	Divino
2.4	25 July 2016	Restructuring Manual for Firmware 2.5 Release	Divino
2.3	18 March 2016	Added Read Screen, Toggle, Slider, and Label Features	Clark
2.2	21 October 2014	Added Scripting, Label, and Strip Chart Features	Clark
2.1	8 April 2014	Added Scripting, Label, and Trace Features	Clark
2.0	8 October 2013	Initial Release	Clark

1 Introduction

1.1 Design

Design Tool

The GTT Design software, available at https://www.matrixorbital.com/software/gtt-software, makes developing beautiful user interfaces and menu structures for the GTT quick and easy. By simulating a selected GTT module, the Design Software allows users to place buttons, shapes, images, graphs and text exactly where they want on their display. With its intuitive design, users will be able to create and deploy multiple screens to be used on their GTT.

Figure 1: GTT Design Software

The simple and intuitive layout of the GTT Design Suite provides users the ability to drag tools onto their simulated GTT screen. Once placed on screen, the user will be able to resize, and reposition the tool to their liking. The properties tab offers more precision when making adjustments to a tool, and allows users to change a plethora of other tool specific parameters.

All of the GTT series commands are available in the GTT Design Software, providing the ability to create scripts that can be deployed onto the GTT. Furthermore, in the GTT Designer, scripts can be linked to tools, and executed whenever the tool is interacted with.

Connections

Multiple communication interfaces are available for the GTT providing the means to communicate to the display using a range of different protocols. Header locations for each available protocol can be found in the GTT Hardware manual. GTT hardware manuals can be found at https://www.matrixorbital.com/documents/manuals.

Power can be applied to the GTT through the selected communication header, the alternate power connector, or if available, a power jack adapter on the display. Please consult your respective GTT Hardware manual for the power specifications, and power supply headers available on your unit.

SD Card

The GTT includes a removable FAT16 format SD card with a 2GB capacity. The GTT is also capable of using higher capacity FAT32 SDHC and exFAT SDXC cards. Images, scripts, and other files can be stored on this SD card, and accessed later during the GTT's operation.

Communication

By default a standard GTT unit is configured to communicate using RS232 protocol. A set of jumpers are used to configure the communication protocol that the GTT will use. These jumpers will have to be relocated in order to alternate between different communication protocols.

Commands can be sent directly to the GTT using a terminal program, or one of the many tools we offer on our website. Software communication settings may need to be adjusted based on the hardware selected communication protocol. In addition, the protocol communication channel may need to be set using the Set Communication Channel command; otherwise the GTT will not return messages through the proper communication protocol.

Basic default settings for serial protocols, which include USB, TTL, RS232, and RS422, as well as I²C protocol are shown below

Table 1: Serial Communication Settings

Speed	Data Bits	Parity	Stop Bits	Flow Control
115.2Kbps	8	None	1	RTS/CTS

Table 2: I²C Communication Settings

Write	Read	Speed
80 _d	81 _d	Up to 100Kbps

Flow Control

Hardware flow control is available on the GTT and can be enabled and disabled at any point using the Set Communication Channel command. The RTS and CTS lines available on the 6 pin Serial Communication Header can be used to indicate whether or not the GTT can accept more data.

GTT's are capable of queuing 4096 bytes of unprocessed data within their data buffers. The GTT will not accept any more data when its buffers are filled, and any data transmitted at that time may be lost. The GTT's flow control feature can limit the amount of data transmitted when the GTT's buffers are filled. This gives the GTT time to parse through and clear its communication buffers. Once more space is available, data transmission can resume as normal.

1.2 Basic Features

Text

While the GTT is not in its Command Processing state, any bytes it receives will be printed in standard ASCII encoding using the currently set font. For example, if the user sends decimal values 72, 101, 108, 108, and 111 to the display, "Hello" will be written on screen.

Commands

When the GTT detects the command prefix character DEC 254, it will enter a command processing state and wait to receive a Command ID along with any associated parameters. Parameters that are larger than 8 bits must be sent using Big Endian format. Once a command has been received, the GTT will process the data, and work towards executing the command. After the command has been executed, the display will automatically exit out of its command processing state, and wait to receive more data.

Table 3: Get Module ID bytes

Prefix	254	The command prefix
Command ID	55	Message ID 55, Get Module ID

By default, there is no timeout implemented on the GTT. This means that if the GTT receives a command prefix character, it will remain in its processing state until all of the expected command parameters are received. This can cause multiple issues if bytes are dropped during transmission, including an unresponsive display and a desynchronized data stream.

It is recommended that all data transmitted to the display is wrapped in Secured Communication packets as a 100 millisecond timeout is applied to all commands sent using this protocol. More information about this timeout feature can be found in the Secured Communication section of this manual.

Return Messages

All response messages that the GTT returns will follow a specific packet format. Each message begins with the return message prefix DEC 252, followed by a Message ID indicating what command is associated with the return. A 2 byte length value will follow, informing the host how many bytes must be read.

Table 4: Example Return Message

Prefix	252	The return message prefix
Message ID	55	Message ID 55, Get Module ID
Length	0	Length MSB
	2	Length LSB
Data	Byte[1]	Module ID MSB
	Byte[2]	Module ID LSB

The sample above shows the expected return values from the Get Module Type. In this manual, synchronous return messages are described below any required parameters. Synchronous return messages can be disabled using the Set Communication Channel command, reducing the amount of data that the host must parse during operation.

Control Characters

The GTT is compatible with a few specific ASCII and UNIX control characters. The GTT can be configured for either Windows or UNIX compatibility modes using the Set Control Character Mode command.

Table 5: Control Characters

		UNIX Compatibility Mode	Windows Compatibility Mode
7	7	The bell character will signal the Default Beep	The bell character will signal the Default Beep
1	.0	Move the text insertion point to the beginning of the next line down	Move the text insertion point down one line
1	.3	Move the text insertion point to the beginning of the	Move the text insertion point back to the beginning of
		next line down	the current line

Drawing

The most basic commands available for the GTT series are the drawing features. Simple shapes, from pixels to triangles, can easily be drawn on the screen using a number of available commands. The coordinate system of the GTT references the top left pixel as (0,0) and increments positively to the right and down, as shown below.

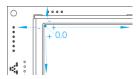

Figure 2: Pixel Coordinate Orientation (GTT43A shown)

The drawing colour can be set globally by specifying values for red, green, and blue channels, and will default to white. The Get Display Metrics command will report the number of bits available for each colour channel. The GTT will use the highest bits of any colour specified, dropping the lowest if necessary. For example, if the display uses 5 bits for red, setting the drawing colour to any value between 0 and 7 will result in the same, black, colour.

Buffers

Certain assets such as Fonts, Bitmaps, 9-Slice images, and Animations files stored on the SD card must be loaded into one of the GTT's on-board Buffers before they can be drawn on screen. Assets are assigned an Index Numbers before being loaded into a buffer and can be accessed at any time by referencing the assigned Index Numbers. Buffers can also be cleared at any time to make space for other assets.

Larger asset files may take longer to load into their buffers, causing a minor delay during operation. Animations files, for example, with a large quantity of frames may take longer to load than other assets due to the number of images being stored.

Depending on the project, it may be beneficial to load all assets into their buffers during the application's initialization. This will lead to quicker response times during operation, in exchange for a longer initialization time. In contrast, buffers can be loaded as-needed, which may result in slower response times between screens, but will provide balance between initialization and operation speeds.

Index Numbers

Tools must be assigned an index number prior to being created. These ID numbers provide the ability to communicate to each tool individually. Information relating to that tool instance is stored with these ID numbers. The assigned tool ID number will be referenced when trying to update or modify said tool.

Tools that require an index number will fall under a specific category: Label, font, bitmap, 9-Slice, animation, bargraph, trace, keys, or region. Each category has been allotted 256 unique index slots, allowing each category to store up to 256 unique assets at once. Tools that fall under the same category must have different ID numbers otherwise they will not function properly.

For example when a new slider is created, all the parameters specified during creation are saved along with its assigned ID number. These parameters include the slider's on-screen coordinates, value range, track/button width and height, 9-Slice files, and style. To retrieve the current value of the slider, the Get Slider Value command will need to be sent, along with the slider's ID number.

Tools that fall under the same category will share the category's index number pool. For example, touch regions, toggles, and sliders all fall under the regions category, and have access to the same index numbers. In order for a tool to function properly, it will need to have its own ID number that is unique from the rest of the tools in their category. In the case that a slider and a toggle are given the same ID, both region tools will be visible on screen, but only one will be functional. This is due to one tool overwriting the data of the other tool.

Fonts

Fonts can be uploaded to the SD memory card and buffered for use on the display. If no other font has been selected or loaded, the GTT will default to a non-scalable proggy font when updating screen text.

Bitmaps

Bitmaps can be uploaded to the SD memory card and used when creating touch regions, sliders or animations. Furthermore, a specific colour can be specified to appear transparent when the bitmap is rendered using the Set Bitmap Transparency command.

Bargraphs

Bargraphs can be easily rendered on the GTT, allowing numerical data to be presented in a graphical manner. Once created, bargraphs can be updated using the Update a Bargraph Value command.

Traces

The GTT's Trace graph feature creates a two-axis graph, perfect for displaying data over time. Both the X and Y axis intervals are determined during creation, and can be changed using the Set Trace Min and Max Values command, allowing for trace scaling.

1.3 Advanced Features

9-Slice

9-Slices files can modify and scale a bitmap without distorting its geometry. A 9-Slice file will cut a bitmap into 9 separate pieces, and automatically adjust each of those 9 pieces in order to scale an image. For instructions on creating a 9-Slice file, along with an example of a 9-Slice, see the 9-Slices file example in section 3.2 of this manual

9-Slice Graphs

9-Slice bargraphs use 9-Slice images loaded in the GTT's buffer to render its graph providing the same functionality as standard bargraphs, but with added graphical depth.

Animations

Animation files may be saved to the SD card, and played on the GTT. In order to run an animation on the display, an animation text file and all accompanying animation frame images must be stored on the GTT SD card. Details on how to create an animation text file can be found in the Animations example within section 3.2 of this manual

Keypad

The GTT is compatible with matrix style keypads, supporting up to 25 keys. Key events will generate a return message that can be transmitted immediately or polled by toggling the Set Keypad Transmit Mode command. A sample return message is shown below.

Prefix	252	The return message prefix
Message ID	165	Message ID 165, Keypad Return ID
Longth	0	Length MSB
Length	2	Length LSB
Event	0	Key Event
Kev ID	65	ID of key pressed

Table 6: Example Keypad Response

Key presses return a message ID of 165, followed by a data length equal to the number of bytes currently in the key buffer. The Key buffer is capable of storing up to 20 keypad events before needing to be read. Each key ID value will be preceded by an event byte as per the Keypad Event Types table.

Table 7: Keypad Event Types

Value	0	1	2
Event	Press	Release	Repeat

Touch

Touch input allows the GTT to return various types of up, down and move messages depending on the reporting style. Two distinct styles are available: region and coordinate. Both generate a return message with an identification number of 135, followed by event information.

Table 8: Touch Event Types

Value	0	1	2
Event	Down	Up	Move

In coordinate mode, the GTT will send an event type as listed above followed by signed short x and y coordinates of the touch location.

Table 9: Example Co-ordinate Response

Prefix 2	252	The sections of the section of the s
		The return message prefix
Message ID	135	Message ID 135, Touch Input
Longth	0	Length MSB
Length	5	Length LSB
Event	0	Touch Event type
х	0	MSB of X coordinate
	50	LSB of X coordinate
v	0	MSB of Y coordinate
'	10	LSB of Y coordinate

Table 10: Example Region Response

Prefix	252	The return message prefix			
Message ID	135	Message ID 135, Touch Input			
Longth	0	Length MSB			
Length 2		Length LSB			
Event	0	Touch Event			
Region	5	ID of region pressed			

In region mode, buttons are defined on the screen. When touch activities occur within a region, a visual update accompanies the event report listed in the Touch Event Types table. Events that occur outside defined regions may be reported as Region 255, when reporting is turned on.

Region

Touch regions may be defined using a simple text file for speed and greater ease of use. In cases where multiple screens share the same region layout, it may be more effective to set up a script that will generate the set of regions, instead of creating each region individually. Details on creating a Region File can be found in section 3.2 of this manual.

Scripts

Script files can be created and loaded onto the GTT and then executed anytime during operation. A script file is comprised of a list of commands and their corresponding parameter information. When a script is executed, all the data within that script will be parsed as if it came from the input communications port. Scripts can be created and tested using the GTT support tool, or generated and deployed using the GTT Designer. Details about creating and running Scripts on the GTT can be found in section 3.2 of this manual.

Autoexec

On startup, the GTT will check the root directory of the SD card for a file named AUTOEXEC. If that file exists, it will be loaded directly into the input buffer and parsed as if it came from the input communications port. This is useful for having custom defaults on startup. Details about setting up an Autoexec File can be found in section 3.2 of this manual.

GTT25 Command Protocol

A new Command protocol is available providing added functionality for users. There are now two Command Protocols for the GTT: The original protocol is now referred to as the GTT20 protocol, also referred to as the Legacy Toolset in the GTT Designer. The second protocol is referred to as the GTT25 protocol, and is the default Toolset in the GTT Designer.

All of the commands listed in this manual are part of the GTT20 Legacy Toolset, and although it is referred to as 'Legacy', there are no plans of removing these commands from the GTT's firmware. The GTT20 protocol will continue to be supported, but commands will no longer be developed using this protocol format.

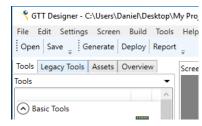

Figure 3: GTT25 (Tools) and GTT20 (Legacy Tools) Options in the GTT

The GTT25 Toolset is a more sophisticated version of the GTT20

Legacy Toolset, offering much of the same tools but with added functionality. The GTT25 Toolset is object oriented, and all future commands will be developed using this approach. With this object oriented approach, GTT25 tool data is now stored on the GTT and can be read back at any point unlike their GTT20 counterparts. For example, the string contents of a GTT25 Label on screen can now be read by the host. More information about the new GTT25 protocol can be found in the GTT Developer's manual.

GTT20 and GTT25 tools can be used in the same project, though it should be noted that GTT25 commands aren't interchangeable with GTT20 commands as GTT25 tools will not respond to GTT20 commands and vice versa. For example, a GTT25 label cannot be updated with a GTT20 Update a Label command.

When working with the GTT Designer, a Report is created upon project generation listing all of the GTT25 commands that are applicable to tools on each screen. This report can be viewed by pressing the report button at the top of the GTT Designer.

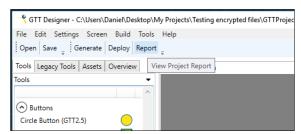

Figure 4: Project Report Button in the GTT Designer

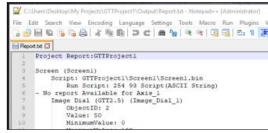

Figure 5: Project Report

Secured Communication

32-bit CRC packet transfers are now available on the GTT allowing users to opt for a more secure data transfer format. A Cyclic Redundancy Check (CRC) allows errors to be detected when data is transferred, and helps reduce communication errors. This 32-bit CRC transfer format is an additional layer applied on top of the regular GTT Command format, and can be used with both the GTT20 and GTT25 Command Protocol.

32-Bit CRC requires a specific set of bytes to be sent in order to operate properly. Sending a DEC 251 will initiate a secured packet transfer, and the GTT will enter a command processing state. The secured packet prefix byte is followed by the length of the GTT Command being sent, along with the GTT Command itself. Finally, a CRC calculation must be applied on all of the preceding bytes. The result of this calculation will be sent after the GTT Command.

Table 11:Get Backlight command wrapped in CRC

Prefix	251	CRC Secured Packet Prefix			
Length	0	Longth of the CTT Command			
Length	2	Length of the GTT Command			
Command	254	GTT Command			
Command	154	GII Command			
	96				
CRC32	167	32-Bit CRC Check Value			
CRC32	244	52-Bit CRC Clieck value			
	86				

Figure 6: CRC Calculation

A 100 millisecond timeout is implemented when using 32-Bit CRC packet transfers with the GTT. This is to prevent the GTT from locking up if data gets lost at any point during transmission. When a timeout occurs, the GTT will discard all of the previous command data it received, and return a CRC status message. This prevents the GTT from locking up in the case that data gets lost during transfer.

Once a CRC transfer is complete, the GTT will issue a packet acknowledgment response to confirm that the packet was received.

Table 12: Example CRC Packet Acknowledgement Response

Prefix	252 Return Message Pre		
Massage ID	251	CRC Status Return	
Message ID	251	Message	
Loughle	0	Length of Return	
Length	1	Message	
Data	0	CRC Status	

Table 13: CRC Status Message

CRC Response	Definition
0	CRC OK
1	CRC Mismatch
2	Packet Timeout

If the GTT command has a synchronous message response associated, the GTT will return the packet acknowledgement response first, then the command result.

A full conversation will look similar to the following:

Table 14: Get backlight command wrapped in CRC

Prefix	251	CRC prefix				
Longth	0	Length MSB				
Length	2	Length LSB				
Command	254	Cat Packlight Command				
	154	Get Backlight Command				
	96					
CRC	167	CRC Check Values				
	244	CNC CHECK Values				
	86					

Table 15: CRC acknowledgement and Backlight return value

ge	Prefix	252	The return message prefix
Packet Acknowledge Return	Message ID	251	Message ID 251, CRC Prefix
P. Krick	Longth	0	Length MSB
Αc	Length	1	Length LSB
	Data	0	CRC Status
	Prefix	252	Return message prefix
mand rn	Message ID	154	Message ID 154, Get Backlight
om	Message ID Length	0	Length MSB
		1	Length LSB
GT	Data		Returned Backlight Data

The CRC Secure packet transfer format also offers a Secure Communication only mode that configures the GTT to exclusively listen to secured packets only. Data that isn't wrapped in a secured packet will be ignored and discarded. This mode can be enabled using the Set Communication Flags command.

1.4 Support

Support Tool

Downloaded from http://www.matrixorbital.ca/software/, the GTT Project support tool provides a simple interface with the full library of GTT series commands. This program can be used to create scripts that can be executed on the GTT, saved, and even loaded for later use.

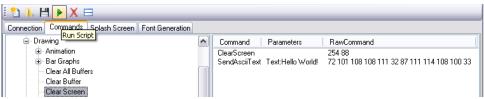

Figure 7: GTT Support Tools

Each command added to the script is displayed along with any applicable parameters. A byte by byte account of the data that will be sent can be found beside the command in decimal notation. While this list of commands can be saved and recalled later, it can also be converted into a binary file using the save as feature. This will allow easy creation of Autoexec Files, and integration into application specific code. Finally, the support tool provides a debug window that will display the information flow to and from your GTT to ensure your command list executes exactly as it was envisioned.

Application Notes

Full demonstration programs and code are available for many different Matrix Orbital displays in a number of different languages from the Application Note section at https://www.matrixorbital.com/app/app-gtt-series.

In addition, all files required to run the short examples described in the Advanced Features section are available for download from https://www.matrixorbital.com/app/app-gtt-series/app-gtt-example. Each example runs as an autoexec script and is described in the Instructions document.

Finally, a self-contained demo highlighting many of the features available in the GTT line is available at https://www.matrixorbital.com/app/app-gtt-series/app-gtt-demo. No code is required as all functionality is provided through scripts. Simply copy the required files to your GTT to run the interactive demo.

For additional information regarding the features implemented, please see the Commands section below. If you have any questions please don't hesitate to contact a knowledgeable Matrix Orbital technical support representative.

Firmware Upgrades

After release, Matrix Orbital may publish updates to the GTT code base or functionality that can be easily applied to the unit in the field. While in mass storage mode replace all of the files in the GTT upgrade folder with the latest package available from https://www.matrixorbital.com/firmware/gtt-firmware. Then, cycle power to the unit, wait for the upgrade to complete, and allow the screen to reboot. Finally, replace the GTT in your application and enjoy the new additions to the display you've come to know and love.

2 Commands

2.1 Communication

1.1 Enter Mass Storage Mode	Dec	254 4	2.0
	Нех	FE 04	
	ASCII	þ [EOT]	

Programmatically force the GTT to enter mass storage mode.

1.2 Set Communication Channel	Dec	254 5	Channel	2.0
	Hex	FE 05	Channel	
	ASCII	þ [ENQ]	Channel	

Set the default communication channel to be used for asynchronous data transmission. Asynchronous data includes responses from the keypad and touchpad. Synchronous data requests, such as commands, are always answered on the requesting channel.

Channel Byte Communication channel type, as per eChannel Values.

Table 16: eChannel Values

Value	Description		
0	None		
1	Serial		
2	I2C		
3	USBMassStorage		
4	CAN		
5	SPI		
255	Current		

1.3 Set Baud Rate	Dec	254 57	BaudRate	2.0
	Hex	FE 39	BaudRate	
	ASCII	þ 9	BaudRate	

Set the serial data rate used by the GTT. The change is implemented immediately after the last parameter byte has been received. Baud rate will reset to 115,200 on power up unless otherwise defined in the autoexec file. This is a serial command only.

BaudRate Integer The desired baud rate value.

1.4 Set Flow Control Mode	Dec	254 58	FlowControl	2.0
	Hex	FE 3A	FlowControl	
	ASCII	þ:	FlowControl	

Set the hardware flow control mode used by the GTT. The default, and recommended, setting is RTSCTS. If buffer overflow is observed please ensure hardware flow control is set to RTSCTS, and implemented. This is a serial command only.

FlowControl Byte Flow control setting, as per eFlowControl Values.

Table 17: eFlowControl Values

Value	Description
0	Off
1	RTSCTS

1.5 Set I2C Address	Dec	254 247	I2Caddress	2.0
	Hex	FE F7	I2Caddress	
	ASCII	þ÷	I2Caddress	

Set the I2C write address of the GTT. Only even values are permitted as the next odd address will become the read address. Default 8 bit address on startup is 80 decimal (0x50 hex) unless otherwise defined in the I2C.cfg file in the \system folder, or the autoexec file. This is an I2C command only.

12Caddress Byte 12C write address, must be an even value.

1.6 Echo	Dec	254 255	Message	2.0		
	Hex	FE FF	Message			
	ASCII	þÿ	Message			
Ask the GTT to echo a string that is sent to it. This command can be used to test communication or indicate						
completion of a successful power up when placed in the autoexec file.						
Message	ASCII String	An arbitrary string that	the module will return. Limited to 4KB in length.			

iviessage	ASCII String	An arbitrary string that the module will return. Limited to 4kB in length.
Return Message	252 255 Length	ReturnMessage
ReturnMessage	ASCII String	The same arbitrary string originally sent.

2.2 Module

2.1 Get Protocol Revision	Dec	254 0	2.0
	Hex	FE 00	
	ASCII	þ [NUL]	

Get the firmware version currently installed on the GTT. Minor revisions will indicate an addition only, while major revisions will alter or remove commands; consult the appropriate changelog for more information on changes. For each command in this manual, the minimum firmware version required is listed at the top right.

Return Message	252 0 Length	Major Minor
Major	Byte	Major revision of the protocol used.
Minor	Byte	Minor revision of the protocol used.

2.2 Reset Module	Dec	254 1	2.0
	Hex	FE 01	
	ASCII	þ [SOH]	

Initiate a soft reset of the GTT. The standard start up sequence will ensue and all settings will revert to defaults.

2.3 Delay	Dec	254 2	Time	2.0
	Нех	FE 02	Time	
	ASCII	þ [STX]	Time	
Pause command exec	ution to and re	esponses from the GTT fo	or the specified length of time	

Time Short Length of delay in milliseconds.

2.4 Get Display Metrics	Dec	254 3	2.0
	Hex	FE 03	
	ASCII	þ [ETX]	

Get the width, height, and colour resolution of the GTT screen.

, 5 ,					
Return Message	252 3 Length	Width Height BitsRed BitsGreen BitsBlue			
Width	Short	Short The width of the current display resolution in pixels.			
Height	Short	The height of the current display resolution in pixels.			
BitsRed	Byte	The number of bits used in the red channel. When less than 8 bits, byte length colour commands use the highest bits.			
BitsGreen	Byte	The number of bits used in the green channel. When less than 8 bits, byte length colour commands use the highest bits.			
BitsBlue	Byte	The number of bits used in the blue channel. When less than 8 bits, byte length colour commands use the highest bits.			

2.5 Set Screen Orientation	Dec	254 50	Orientation	2.5
	Hex	FE 32	Orientation	
	ASCII	þ 2	Orientation	
Set the orientation of the GTT screen or flipped orientation. Default is I		mand is useful for a	pplications where the	GTT is installed in a portrait
Orientation	Byte	Desired screen ori	entation, as per ePane	elOrientation Values.

Table 18: ePanelOrientation Values

Value	Description
0	Landscape
1	PortraitClockwise
2	LandscapeFlipped
3	PortraitCounterClockwise

2.6 Set Customer Data	Dec	254 52	Length Data		2.0	
	Hex	FE 34	Length Data			
	ASCII	þ 4	Length Data			
Write information to a specific file	in non-volatil	e. Up to 255 bytes o	can be written to the u	serdata.dat file in the		
\system folder of the GTT SD card	using this con	nmand. This data co	ould potentially be unit	identification, network	(
information, system settings, or anything else specific to the module.						
Length	Byte	Length of the data	to be transferred, in b	ytes.		
Data	Byte(s)					

2.7 Get Customer Data	Dec	254 53	2.0			
	Hex	FE 35				
	ASCII	þ 5				
Read data from the userdata	dat file in the \system	folder of the GTT SD card.				
Return Message	Return Message 252 53 Length Length Data					
Length	Byte	Length of the data to be transferred, in bytes.				
Data	Byte(s)	Data read from the SD Card.				

2.8 Get Module Type	Dec	254 55 2
	Hex	FE 37
	ASCII	þ 7
Get a two byte value u		
Return Message	252 55 Le	_
Module	Short	The unique number of the module, as per eModule Values
Table .	19: eModule Values	Table 20: eModule Values continued

2.3 Drawing

3.1 Set Background Drawing	Dec	254 86	RGB	2.0		
Colour	Hex	FE 56	RGB			
	ASCII	þV	RGB			
Set the colour that is used for the background of all drawing commands, and fills the screen when a Clear Screen						
command is sent to the GTT. The	command is sent to the GTT. The default background colour is black.					
R	R Intensity of red, 0 to 255, limited to display metrics.					
G Intensity of green, 0 to 255, limited to display metrics.						
В	Byte	Intensity of blue, 0 to 255, limited to display metrics.				

3.2 Get Background Drawing	Dec	254 87	2.0		
Colour	Hex	FE 57			
	ASCII	þW			
Get the current background draw	Get the current background drawing colour of the GTT.				
Return Message	252 87 Length	RGB			
R	Byte	Intensity of red, 0 to 255, limited to display metrics.			
G	Byte	Intensity of green, 0 to 255, limited to display metrics.			
В	Byte	Intensity of blue, 0 to 255, limited to display metrics.			

3.3 Clear Screen	Dec	254 88	2.0
	Hex	FE 58	
	ASCII	þΧ	

Clear the screen, and reset the coordinates for both the Continue Line and Text Window commands to zero.

3.4 Scroll Screen	Dec	254 89 X Y Width Height MoveX MoveY	2.0
	Hex	FE 59 X Y Width Height MoveX MoveY	
	ASCII	þ Y X Y Width Height MoveX MoveY	
Scroll the contents of a specifi	ed portion of the	GTT screen.	
X	Signed Short	Leftmost coordinate of the scroll window.	
Υ	Signed Short	Topmost coordinate of the scroll window.	
Width	Signed Short	Width of the scroll window.	
Height	Signed Short	Height of the scroll window.	
MoveX	Signed Short	Number of pixels to scroll horizontally.	
MoveY	Signed Short	Number of pixels to scroll vertically.	

3.5 Enable Manual Update	Dec	254 90	Enable	2.0
	Hex	FE 5A	Enable	
	ASCII	þΖ	Enable	

Enable manual graphic updates. This command stops all drawing commands from automatically updating the screen and sends them to the display buffer to be executed simultaneously when the Manual Update command is sent to the GTT. This command is useful for displaying a complicated image as a single visual update. Default is disabled.

Enable Desired manual update setting, as per eEnable Values.

Table 25: eEnable Values

Value	Description
0	Disable
1	Enable

3.6 Manual Update	Dec	254 91	2.0
	Hex	FE 5B	
	ASCII	þ [

Immediately push all contents of the display buffer to the screen.

3.7 Flush Region	Dec	254 92 X Y Width Height	2.0
	Hex	FE 5C X Y Width Height	
	ASCII	þ\ XY Width Height	
Immediately push all graphic	data in a specifie	ed region of the display buffer to the screen. This command has no	
effect if manual update is disa	bled.		
X	Signed Short	Leftmost coordinate of the flush window.	
Υ	Signed Short	Topmost coordinate of the flush window.	
Width	Signed Short	Width of the flush window.	
Height	Signed Short	Height of the flush window.	

3.8 Set Drawing Colour	Dec	254 99	RGB		2.0
	Hex	FE 63	R G B		
	ASCII	þс	R G B		
Set the colour that is used for the	foreground of a	II drawing comma	nds sent to the GTT	The default drawing colo	ur

Set the colour that is used for the foreground of all drawing commands sent to the GTT. The default drawing colour is white.

R	Byte	Intensity of red, 0 to 255, limited to display metrics.
G	Byte	Intensity of green, 0 to 255, limited to display metrics.
В	Byte	Intensity of blue, 0 to 255, limited to display metrics.

	-	274400			
3.9 Get Drawing Colour	Dec	254 100 2.0			
	Hex	FE 64			
Cat the gurrant faragraums	ASCII	þ d			
Get the current foreground					
Return Message	252 100 Lengt				
R	Byte	Intensity of red, 0 to 255, limited to display metrics.			
G	Byte	Intensity of green, 0 to 255, limited to display metrics.			
В	Byte	Intensity of blue, 0 to 255, limited to display metrics.			
3.10 Continue Line	Dog	2F4 101 VV			
3.10 Continue Line	Dec Hex	254 101 X Y 2.0 FE 65 X Y			
	ASCII	be XY			
Draw a line from the last n		ordinate specified using the current drawing colour. The last stored			
		Draw Line, and Continue Line commands.			
X	Signed Short				
Υ	Signed Short	Vertical coordinate of line terminus.			
	Signed Short	vertical coordinate of fine terminus.			
3.11 Draw Line	Dec	254 108 X1 Y1 X2 Y2 2.0			
J.11 Diaw Line	Hex FE 6C X1 Y1 X2 Y2				
	ASCII	b I X1 Y1 X2 Y2			
Draw a line connecting two		rrent drawing colour. Lines may be rendered differently when drawn			
right to left versus left to ri		The control of the co			
X1	-	orizontal coordinate of first line terminus.			
Y1	Signed Short Vertical coordinate of first line terminus.				
X2	Signed Short Horizontal coordinate of second line terminus.				
Y2	-	ertical coordinate of second line terminus.			
12	Signed Short	critical coordinate of second line terminus.			
3.12 Draw Pixel	Dec	254 112 X Y 2.0			
	Hex	FE 70 X Y			
	ASCII	þр XY			
Draw a single pixel at the s	pecified coordinate u	sing the current drawing colour.			
X		Horizontal position of pixel to be drawn.			
Υ		/ertical position of pixel to be drawn.			
	0.0.00				
3.13 Draw Rectangle	Dec	254 114 X Y Width Height 2.0			
	Hex	FE 72 X Y Width Height			
	ASCII	þr XY Width Height			
Draw a rectangular frame of	one pixel wide using t	he current drawing colour.			
X	Signed Short	Leftmost coordinate of the rectangle.			
Υ	Signed Short	Topmost coordinate of the rectangle.			
Width	Short	Width of the rectangle.			
Height	Short	Height of the rectangle.			
	The light of the restangle.				

3.14 Draw Filled Rectangle	Dec	254 120 X Y Width Height	2.0
	Hex	FE 78 X Y Width Height	
	ASCII	þ x X Y Width Height	
Draw a filled rectangle using	the current drawing	g colour.	
X	Signed Short	Leftmost coordinate of the rectangle.	
Υ	Signed Short	Topmost coordinate of the rectangle.	
Width	Short	Width of the rectangle.	
Height	Short	Height of the rectangle.	
3.15 Draw Circle	Dec	254 123 X Y Radius	2.0
3.13 Draw Circle	Hex	FE 7B X Y Radius	2.0
	ASCII	þ { X Y Radius	
Draw a circular frame one pix			
X		Horizontal coordinate of circle centre.	
Υ		Vertical coordinate of circle centre.	
	- 0		
Radius	Short	Radius of the circle.	
3.16 Draw Filled Circle	Dec	254 124 X Y Radius	2.0
	Hex	FE 7C X Y Radius	
	ASCII	b X Y Radius	
Draw a filled circle using the	current drawing col	our.	
x	Signed Short	Horizontal coordinate of circle centre.	
Υ	Signed Short	Vertical coordinate of circle centre.	
Radius	Short	Radius of the circle.	
3.17 Draw an Ellipse	Dec	254 125 X Y XRadius YRadius	2.0
	Hex	FE 7D X Y XRadius YRadius	
	ASCII	þ } X Y XRadius YRadius	
Draw an elliptical frame one		_	
X		Horizontal coordinate of ellipse centre.	
Υ		Vertical coordinate of ellipse centre.	
XRadius	Short	Horizontal Radius of the ellipse.	
YRadius	Short	Vertical Radius of the ellipse.	
3.18 Draw a Filled Ellipse	Dec	254 126 X Y XRadius YRadius	2.0
	Hex	FE 7E X Y XRadius YRadius	2.0
	ASCII	b ~ X Y XRadius YRadius	
Draw a filled ellipse using the		·	
X	Signed Short	Horizontal coordinate of ellipse centre.	
Υ	Signed Short	Vertical coordinate of ellipse centre.	
XRadius	Short	Horizontal Radius of the ellipse.	

Vertical Radius of the ellipse.

YRadius

Short

3.19 Draw Rounded Rectangle	Dec	254 127	X Y Width Height Radius	2.0	
	Hex	FE 7F	X Y Width Height Radius		
	ASCII	þ∙	X Y Width Height Radius		
Draw a rectangular frame one pi	kel wide with rou	unded corners using t	the current drawing colour.	The radius must be	
equal to or less than half the leng	ngth of the smallest side of the rectangle.				
X	Signed Short	Leftmost coordinat	e of the rectangle.		
Υ	Signed Short Topmost coordinate of the rectangle.				
Width	Signed Short	ned Short Width of the rectangle.			
Height	Signed Short	Height of the rectar	ngle.		
Radius	Short	Radius of the round	ded corners.		

3.20 Draw Filled Rounded	Dec	254 128	X Y Width Height Radius	2.0	
Rectangle	Hex	FE 80	X Y Width Height Radius		
	ASCII	þ€	X Y Width Height Radius		
Draw a filled rectangle with ro	unded corners usir	ng the current drawing	colour. The radius must be equal	l to or less	
than half the length of the sma	llest side of the re	ctangle.			
X	Signed Short	Signed Short Leftmost coordinate of the rectangle.			
Υ	Signed Short	Signed Short Topmost coordinate of the rectangle.			
Width	Signed Short	Width of the rectan	gle.		
Height	Signed Short	Signed Short Height of the rectangle.			
Radius	Short	Radius of the round	ed corners.		

3.21 Draw Triangle	Dec	254 129 X1 Y1 X2 Y2 X3 Y3	2.0		
	Hex	FE 81 X1 Y1 X2 Y2 X3 Y3			
	ASCII	þ• X1 Y1 X2 Y2 X3 Y3			
Draw a triangular frame one pixe	el wide using the	current drawing colour.			
X1	Signed Short	Horizontal coordinate of the first point.			
Y1	Signed Short	Vertical coordinate of the first point.			
X2	Signed Short	Signed Short Horizontal coordinate of the second point.			
Y2	Signed Short	Vertical coordinate of the second point.			
Х3	Signed Short	Horizontal coordinate of the third point.			
Y3	Signed Short	Vertical coordinate of the third point.			

		-			
3.22 Draw Filled Triangle	Dec	254 130	X1 Y1 X2 Y2 X3 Y3	2.0	
	Hex	FE 82	X1 Y1 X2 Y2 X3 Y3		
	ASCII	þ,	X1 Y1 X2 Y2 X3 Y3		
Draw a filled triangle using the co	urrent drawing c	olour.			
X1	Signed Short	Horizontal coordinate of the first point.			
Y1	Signed Short	Vertical coordinate of the first point.			
X2	Signed Short	Horizontal coordinate of the second point.			
Y2	Signed Short	Vertical coordinate of the second point.			
X3	Signed Short	Horizontal coordinate of the third point.			
Y3	Signed Short	Vertical coordinate of the third point.			

2.4 Buffers

4.1 Load Font	Dec	254 40	FontID FileName	2.0
	Hex	FE 28	FontID FileName	
	ASCII	þ (FontID FileName	
Load a font file from the SD version 2.5, .otf.	card into a font b	uffer for use. Suppor	ted font types include .ttf, .fon, and as of firm	nware
FontID	Byte	Index used to ident	fy the font. Specific to fonts.	
FileName	ASCII String	Filename, including	path from the root folder, of the font file to	load.
Return Message	252 40 Length	Result		
Result	Byte	Outcome of Load Fo	ont command, as per eStatusCode Values.	

400 10 0 1	-	25424 7/7/10/10/10/10/10/10/10/10/10/10/10/10/10/
4.2 Read Screen Rectangle	Dec	254 94 X Y Width Height Format 2.4
	Hex	FE 5E X Y Width Height Format
	ASCII	þ ^ X Y Width Height Format
blue colour levels are returned for	every pixel. The s	screen area. Three byte values, representing red, green, and specified area must be less than 21,845 pixels in area due to e a considerable length of time to read large screen areas.
X	Short	Leftmost coordinate of the screen rectangle to read.
Υ	Short	Topmost coordinate of the screen rectangle to read.
Width	Short	Width of the screen rectangle to read.
Height	Short	Height of the screen rectangle to read.
Format	Byte	Pixel format of the screen data, as per ePixelFormat Values.
Return Message	252 94 Length	Result Format Length Data
Result	Byte	Outcome of the Read Screen Rectangle command, as per eStatusCode Values.
Format	Byte	Pixel format of the screen data, as per ePixelFormat.
Length	Short	Length of the data to be transferred, in bytes.
Data	Byte(s)	Current pixel data for every point within the specific rectangle, as per ePixelFormat. Values start at the top left of the rectangle, moving right, then down.

Table 26: ePixelFormat Values

Value	Description
0	RGB16
1	RGB24
3	BGR24

4.3 Load Bitmap	Dec	254 95	BitmapID FileName	2.0
	Hex	FE 5F	BitmapID FileName	
	ASCII	þ _	BitmapID FileName	
Load a bitmap file from the SD card into a bitmap buffer for use. Supported formats are BMP, GIF, JPG, and PNG.				JPG, and PNG. All
files should be in RGB for	ormat; alpha and other o	channels are not supp	oorted.	
BitmapID	Byte	Index used to identification rectangles.	tify the bitmap. Specific to bitm	naps, and screen
FileName	ASCII String	ASCII String Filename, and path from the root folder, of the bitmap file to loa		
Return Message	252 95 Length	Result		
Result	Byte	Outcome of Load B	Sitmap command, as per eStatu	usCode Values.

4.4 Copy Screen Rectangle	Dec	254 96	BitmapID X Y Width Height	2.0
	Hex	FE 60	BitmapID X Y Width Height	
	ASCII	þ`	BitmapID X Y Width Height	
Load a copy of a specific portion o	f the screen into	a bitmap buffer for	later use.	
BitmapID	Byte	Index used to iden	tify the screen section. Specific to bitmap	S
		and screen rectang	gles.	
X	Signed Short	Leftmost coordina	te.	
Υ	Signed Short	Topmost coordina	te.	
Width	Short	Width of the scree	en section.	
Height	Short	Height of the scree	en section.	

4.5 Load 9-Slice	Dec	254 144	NineSliceID Filename	2.0
	Hex	FE 90	NineSliceID Filename	
	ASCII	þ •	NineSliceID Filename	
Load a 9-slice file from the more information.	SD card into a 9-Slice	buffer for use. Refer to	the 9-Slices entry in the Featu	res section for
NineSliceID	Byte	Index used to identify	the 9-slice. Specific to 9-slices	j.
Filename	ASCII String	Filename, and path fro	om the root folder, of the 9-Slid	ce file to load.
Return Message	252 144 Length	Result		
Result	Byte	Outcome of Lond O CI:	ce command, as per eStatusCo	l - \

4.6 Load Animation	Dec	254 192	AnimationID Filename	2.0	
	Hex	FE CO	AnimationID Filename		
	ASCII	þÀ	AnimationID Filename		
Load an animation file from the Features section for more inform	Load an animation file from the SD card into an animation buffer for use. Refer to the Animations entry in the				
AnimationID	Byte	Index used to identify this animation file. Specific to animations.			
Filename	ASCII String	Filename, and path from the root folder, of the animation file to load.			

4.7 Clear a Buffer	Dec	254 208	Type ID	2.0	
	Hex	FE D0	Type ID		
	ASCII	þĐ	Type ID		
Clear data from a specific index	of the selecte	d buffer type to free F	RAM. Labels and	d Traces save a background image	
to a bitmap buffer upon initializ	to a bitmap buffer upon initialization, and will be affected by this command.				
Туре	Byte	Type of buffer to clear, as per eBuffers Values.			
ID	Byte	Index of the file to be cleared from buffer memory.			

Table 27: eBuffers Values

Value	Description
0	Animations
1	Bitmaps
2	NineSlices
3	Fonts
4	Labels
5	Traces

4.8 Clear All Buffers	Dec 254 209	2.0
	Hex FE D1	
	ASCII þ Ñ	

Clear all data from all buffers to free significant RAM.

2.5 Text

5.1 Create a Label	Dec	254 16	LabelID X Y Width Height Rot VJst HJst Font R G B	2.1
	Hex	FE 10	LabelID X Y Width Height Rot VJst HJst Font R G B	
	ASCII	þ [DLE]	LabelID X Y Width Height Rot VJst HJst Font R G B	

Designate a portion of the screen that can be updated with one line of text. A label is useful for displaying dynamic strings or changing numeric variables. Please note that the background of the label is saved to RAM upon creation and redrawn before each update.

·		
LabelID	Byte	Index used to identify this label in the label list.
X	Signed Short	Leftmost coordinate of the label region.
Υ	Signed Short	Topmost coordinate of the label region.
Width	Signed Short	Width of the label region in pixels.
Height	Signed Short	Height of the label region in pixels.
Rot	Signed Short	Rotation of the text within the label.
VJst	Byte	Vertical justification of text within the label, as per
		eFontAlignVertical Values.
HJst	Byte	Horizontal justification of text within the label, as per
		eFontAlignHorizontal Values.
Font	Byte	Font index of a previously loaded font to be used for the label.
R	Byte	Intensity of red, 0 to 255, used for label font colour.
G	Byte	Intensity of green, 0 to 255, used for label font colour.
В	Byte	Intensity of blue, 0 to 255, used for label font colour.

2	Center

5.2 Update a Label (ASCII)	Dec	254 17	LabelID Format Value	2.1
	Hex	FE 11	LabelID Format Value	
	ASCII	þ	LabelID Format Value	
Update a previously created label	with new ASCII tex	xt. Send a null c	haracter (empty string) to clear a	label.
LabelID	Byte	Index used to i	dentify this label in the label list.	
Format	Fixed Decimal	Format of the specify 0.	ASCII string that will update the la	abel. For ASCII
Value	ASCII String		natted string to display within the gle line in height.	e label. String

5.3 Update a Label (Unicode)	Dec	254 17	LabelID Format Value	2.1
	Hex	FE 11	LabelID Format Value	
	ASCII	þ	LabelID Format Value	
Update a previously created label	with new Unicode	text. Send a null ch	aracter (empty string) to clear a label.	
LabelID	Byte	Index used to ider	ntify this label in the label list.	
Format	Fixed Decimal	Format of the strip specify 1.	ng that will update the label. For Unicode	е
Value	Unicode String	New Unicode strir a single line in hei	ng to display within the label. String shou ght.	ıld be

5.4 Update a Label (UTF8)	Dec	254 17	LabelID Format Value	2.1	
	Hex	FE 11	LabelID Format Value		
	ASCII	þ	LabelID Format Value		
Update a previously created label	with new UTF8 tex	xt. Send	l a null character (empty string) to clear a label.		
LabelID	Byte	rte Index used to identify this label in the label list.			
Format	Fixed Decimal	Forma 2.	t of the string that will update the label. For UTF8 spe	cify	
Value	UTF8 String		ITF-8 string to display within the label. String should b line in height.	e a	

5.5 Set Label Activation State	Dec	254 19	LabelID State	2.4
	Hex	FE 13	LabelID State	
	ASCII	þ	LabelID State	
Set the activation state of an exis	ting label. This con	nmand can be used	to temporarily disable updates from	
appearing on the screen, without	deleting a label. D	efault after label cr	eation is Active.	
LabelID	Byte	Index used to iden	tify this label in the label list.	
State	Byte	New label activati	on state, as per eActivation Values.	
Return Message	252 19 Length	Result		
Result	Byte	Outcome of Set La	bel Activation command, as per eStatus	Code
		Values.		

Table 30: eActivation Values

Value	Description
0	Inactive
1	Active

5.6 Get Label Activation State	Dec	254 20	LabelID	2.4
	Hex	FE 14	LabelID	
	ASCII	þ	LabelID	
Get the current activation state of	an existing label.			
LabelID	Byte	Index used to ider	tify this label in the label list.	
Return Message	252 20 Length	Result State		
Result	Byte	Outcome of Get La Values.	abel Activation command, as per eStatusCo	ode
State	Byte	Current label activ	ration state, as per eActivation Values.	

5.7 Set Label Font Colour	Dec	254 21	LabelID R G B	2.4
	Hex	FE 15	LabelID R G B	
	ASCII	þ	LabelID R G B	
Set the font colour of an existing I	abel. This comma	nd overrides the init	tial font colour, and im	mediately redraws the
current text of the label in the new	w colour.			
LabelID	Byte	Index used to ider	ntify this label in the lab	oel list.
R	Byte	Intensity of red, 0	to 255, limited to disp	lay metrics.
G	Byte	Intensity of green,	, 0 to 255, limited to di	splay metrics.
В	Byte	Intensity of blue, (0 to 255, limited to disp	olay metrics.
Return Message	252 21 Length	Result		
Result	Byte	Outcome of Set La	abel Font Colour comm	and, as per eStatusCode
		Values.		

5.8 Get Label Font Colour	Dec	254 22	LabelID	2.4	
	Hex	FE 16	LabelID		
	ASCII	þ	LabelID		
Get the current font colour of a	n existing label.				
LabelID	Byte	Index used to ider	ntify this label in the label list.		
Return Message	252 22 Length	Result R G B			
Result	Byte	Outcome of Get Label Font Colour command, as per			
		eStatusCode Values.			
R	Byte	Intensity of red, 0 to 255, limited to display metrics.			
G	Byte	Intensity of green, 0 to 255, limited to display metrics.			
В	Byte	Intensity of blue,	0 to 255, limited to display metrics	s.	

5.9 Set Label Font Size	Dec Hex ASCII	254 23 FE 17 þ	LabelID Size LabelID Size LabelID Size	2.4
Set the font size of an existing labe current text of the label in the new		overrides the initial	font size, and immediately redraws the	
LabelID	Byte	Index used to ider	tify this label in the label list.	
Size	Byte	New label size.		
Return Message	252 23 Length	Result		
Result	Byte	Outcome of Set La Values.	bel Font Size command, as per eStatusCo	de

5.10 Get Label Font Size	Dec	254 24	LabelID 2	2.4
	Hex	FE 18	LabelID	
	ASCII	þ	LabelID	
Get the current font size of an e	xisting label.			
LabelID	Byte	Index used to ider	ntify this label in the label list.	
Return Message	252 24 Length	Result Size		
Result	Byte	Outcome of Get L Values.	abel Font Size command, as per eStatusCode	
Size	Byte	Current label size.		

5.11 Set Label Background	Dec	254 25	LabelID R G B	2.6
Colour	Hex	FE 19	LabelID R G B	
	ASCII	þ	LabelID R G B	
Set the background colour of an e	xisting label. This	command overrides	the initial background colour, and	
immediately redraws the current	background and te	ext of the label in the	e new colour.	
LabelID	Byte	Index used to iden	tify this label in the label list.	
R	Byte	Intensity of red, 0	to 255, limited to display metrics.	
G	Byte	Intensity of green,	0 to 255, limited to display metrics.	
В	Byte	Intensity of blue, 0	to 255, limited to display metrics.	
Return Message	252 25 Length	Result		
Result	Byte	Outcome of Set La eStatusCode Value	bel Background Colour command, as per es.	

5.12 Get Label Background	Dec	254 26	LabelID	2.6
Colour	Hex	FE 1A	LabelID	
	ASCII	þ	LabelID	
Get the current background cold	our of an existing lab	bel.		
LabelID	Byte	Index used to ider	ntify this label in the label list.	
Return Message	252 26 Length	Result R G B		
Result	Byte	Outcome of Get L	abel Background Colour command, as pe	٢
		eStatusCode Valu	es.	
R	Byte	Intensity of red, 0 to 255, limited to display metrics.		
G	Byte	Byte Intensity of green, 0 to 255, limited to display metrics.		
В	Byte	Byte Intensity of blue, 0 to 255, limited to display metrics.		

5.13 Cache Font Characters	Dec	254 27	FontID PtSize Rot Format Value	2.6
(ASCII)	Hex	FE 1B	FontID PtSize Rot Format Value	
	ASCII	þ	FontID PtSize Rot Format Value	
Set the characters that will be cac	hed in memory for	a specific font, size	, and rotation. Caching allows faster visua	il
updates for dynamic labels and te	xt.			
FontID	Byte	Font index used to	identify the desired font file in the font	
		buffer.		
PtSize	Byte	Point size of the d	esired characters to cache.	
Rot	Signed Short	Rotation of the tex	xt to cache.	
Format	Fixed Decimal	Format of the strir	ng that will specify the characters to be	
		chached. For ASC	II specify 0.	
Value	ASCII String	ASCII String of cha	racters to be cached.	
Return Message	252 27 Length	Result		
Result	Byte	Outcome of Cache	Font Characters command, as per	
		eStatusCode Value	es.	

5.14 Cache Font Characters	Dec	254 27	FontID PtSize Rot Format Value	2.6
(Unicode)	Нех	FE 1B	FontID PtSize Rot Format Value	
	ASCII	þ	FontID PtSize Rot Format Value	
Set the characters that will be cac	hed in memory for	a specific font	, size, and rotation. Caching allows faster visua	al
updates for dynamic labels and te	xt.			
FontID	Byte	Font index u	sed to identify the desired font file in the font	
		buffer.		
PtSize	Byte	Point size of	the desired characters to cache.	
Rot	Signed Short	Rotation of t	he text to cache.	
Format	Fixed Decimal	Format of th	e string that will specify the characters to be	
		chached. Fo	r Unicode specify 1.	
Value	Unicode String	Unicode Stri	ng of characters to be cached.	
Return Message	252 27 Length	Result		
Result	Byte	Outcome of	Cache Font Characters command, as per	
		eStatusCode	Values.	

5.15 Cache Font Characters (UTF8)	Dec Hex ASCII	254 27 FE 1B b	FontID PtSize	Rot Format Value Rot Format Value Rot Format Value	2.6

5.16 Clear Cached Characters	Dec Hex		FontID PtSize Rot FontID PtSize Rot	2.6
	ASCII	þ	FontID PtSize Rot	
Clear cached characters from men	•	•		ut removes
any increase in the visual update	speed for labels an	d text associated wi	ith the font.	
FontID	Byte	Font index used to buffer.	o identify the desired font file in	the font
PtSize	Byte	Point size of the d	esired characters to clear.	
Rot	Signed Short	Rotation of the tex	xt to clear.	
Return Message	252 28 Length	Result		
Result	Byte	Outcome of Clear eStatusCode Value	Cached Characters command, as es.	s per

5.17 Clear All Cached Characters	Dec 254 29	2.6
	Hex FE 1D	
	ASCII þ	
Clear all cached characters from m	nemory for all font, sizes, and rotatio	ns. This command frees a significant amount of

Clear all cached characters from memory for all font, sizes, and rotations. This command frees a significant amount of RAM, but removes any increase in the visual update speed of all labels and text.

Return Message	252 29 Length	Result
Result	Byte	Outcome of Clear All Cached Characters command, as per
		eStatusCode Values.

5.18 Print Unicode String	Dec	254 36	Text	2.0
	Нех	FE 24	Text	
	ASCII	þ\$	Text	
Print a unicode formatted string	o the current text v	window.		
Text	Unicode String	Unicode formatte	d string.	

5.19 Print UTF-8 String	Dec	254 37	Text	2.0
	Нех	FE 25	Text	
	ASCII	þ %	Text	
Print a UTF-8 formatted string to	he current text	window.		
Text	UTF8 String	UTF-8 formatted s	tring.	

5.20 Set Control Character	Dec	254 38	Mode	2.0
Mode	Hex	FE 26	Mode	
	ASCII	þ &	Mode	
Set the behavior of the characters defined in the control characters section. Default is Unix mode				

Set the behavior of the characters defined in the control characters section. Default is only mode.				
Mode	Byte	Desired control character mode, as per eControlCharacterMode Values.		

Table 31: eControlCharacterMode Values

Value	Description
0	Unix
1	Windows

5.21 Get Control Character	Dec	254 39 2.0
Mode	Hex	FE 27
	ASCII	þ'
Get the current control character	mode.	
Return Message	252 39 Length	Mode
Mode	Byte	Current control character mode, as per eControlCharacterMode Values.

5.22 Get String Extents	Dec	254 42	Text		2.0
	Нех	FE 2A	Text		
	ASCII	þ *	Text		
				 	 _

Get the width and height of a box that a specific string would occupy if it was rendered on the GTT, with the current font. This command is useful for positioning and clearing text on the display.

Text	ASCII String	String whose extents are desired.
Return Message	252 42 Length	Width Height
Width	Short	Width of the rendered string.
Height	Short	Height of the rendered string.

5.23 Set Text Window	Dec	254 43	X Y Width Height	2.0
	Hex	FE 2B	X Y Width Height	
	ASCII	þ +	X Y Width Height	
Set the position and size of the cu	rrent text windo	w on the screen. Al	I future text insertion and print string	
commands will be confined to this	s window. The d	efault window is the	e entire screen.	
X	Signed Short	Leftmost coordina	te of the text window.	
Υ	Signed Short	Topmost coordina	te of the text window.	
Width	Short	Width of the text	window.	

5.24 Get Text Window	Dec	254 44	2.0
	Hex	FE 2C	
	ASCII	þ,	

Height of the text window.

Get the position and size of the current text window.

Short

Return Message	252 44 Length	X Y Width Height
X	Signed Short	Leftmost coordinate of the text window.
Υ	Signed Short	Topmost coordinate of the text window.
Width	Short	Height of the text window.
Height	Short	Height of the text window.

5.25 Reset Font	Dec	254 45	2.0
	Hex	FE 2D	
	ASCII	þ -	

Reset the font at ID 0 to the default GTT proggy style, with the last selected text colour.

5.26 Set Text Colour	Dec	254 46	RGB	2.0
	Hex	FE 2E	R G B	
	ASCII	þ.	R G B	
Set the colour of the current font and other fonts are not affected.	· · · · · · · · · · · · · · · · · · ·		label commands sent to the GTT. Existing te	xt
R	Ryte	Intensity of red 0	to 255 limited to display metrics	

R	Byte	Intensity of red, 0 to 255, limited to display metrics.
G	Byte	Intensity of green, 0 to 255, limited to display metrics.
В	Byte	Intensity of blue, 0 to 255, limited to display metrics.

Height

5.27 Get Text Colour	Dec	า	54 47	2.0
5.27 Get Text Colour	Hex	_	FE 2F	2.0

5.33 Set Text Insertion Point	Dec	254 121	XY	2.0	
	Hex	FE 7 9	XY		
	ASCII	þу	XY		
Set the upper left coordinate of the next printed string to be displayed, relative to the current text window.					
X	Signed Short	Desired leftmost co	ordinate of the insertion point.		
Υ	Signed Short	Desired topmost co	ordinate of the insertion point.		

5.34 Get Text Insertion Point	Dec 254	122 2.0
	Hex FE	7A
	ASCII	þ z

Get the upper left coordinate of the next printed string to be displayed within the current text window.

Return Message	252 122 Length	XY
X	Signed Short	Current leftmost coordinate of the insertion point.
Υ	Signed Short	Current topmost coordinate of the insertion point.

	_				
5.35 Set Font Rendering Style	Dec	254 211	RenderType		2.0
	Hex	FE D3	RenderType		
	ASCII	þÓ	RenderType		
<u> </u>		ent font used for all print string and create label commands. Greyscale offers a cost of performance. Default is greyscale.			
RenderType	Byte Rendertype, as per eFontRenderType Values.				

Table 32: eFontRenderType Values

Value	Description
0	Grayscale
1	Monochrome

5.36 Set Font Anchor Style	Dec	254 212	AnchorType	2.0
	Hex	FE D4	AnchorType	
	ASCII	þÔ	AnchorType	
Set the anchoring style of the current text window font. Note that labels use only BaseLine rendering. The default				
style for text windows is UpperLe	ft.			
AnchorType	Byte	Type of anchor, as p	er eAnchor.	

Table 33: eAnchorType Values

Value	Description
0	UpperLeft
1	BaseLine

2.6 Bitmaps

6.1 Display Bitmap	Dec	254 97	BitmapID X Y	2.0
	Hex	FE 61	BitmapID X Y	
	ASCII	þa	BitmapID X Y	
Display a bitmap image on th	e screen, from the bit	tmap buffer.		
BitmapID	Byte	Byte Index used to identify the desired file in the bitmap buff		er.
X	Signed Short	Signed Short Leftmost coordinate.		
Υ	Signed Short	Topmost coording	nate.	
Return Message	252 97 Length	Result		
Result	Byte	Outcome of Disp	lay Bitmap command, as per eStatusCoo	de
		Values.		

6.2 Set Bitmap Transparency	Dec	254 98	BitmapID R G B	2.0
	Hex	FE 62	BitmapID R G B	
	ASCII	þb	BitmapID R G B	
Set the transparent colour for al	I future renderings	of a specific bitmap	index. Does not affect previously d	rawn
versions of the specified bitmap				
BitmapID	Byte	Index used to ide	ntify the desired file in the bitmap be	uffer.
R	Byte	Intensity of red, 0	to 255, limited to display metrics.	
G	Byte	Intensity of green	, 0 to 255, limited to display metrics	j.
В	Byte	Intensity of blue,	0 to 255, limited to display metrics.	
Return Message	252 98 Length	Result		
Result	Byte	Outcome of Set B eStatusCode Valu	itmap Transparency command, as poes.	er

2.7 NineSlices

7.1 Display 9-Slice	Dec	254 145	NineSliceID X Y Width Height	2.0
	Hex	FE 91	NineSliceID X Y Width Height	
	ASCII	þʻ	NineSliceID X Y Width Height	
Display a 9-slice image on the screen, from the 9-slice buffer.				
NineSliceID	Byte Index used to identify the desired file in the 9-slice buffer.			
X	Signed Short Leftmost coordinate.			
Υ	Signed Short	Signed Short Topmost coordinate.		
Width	Short	Short Width of the 9-slice.		
Height	Short	Short Height of the 9-slice.		

2.8 Animations

8.1 Set Up Animation	Dec	254 193	AnimationID AnimationInstance X Y	2.0		
	Hex	FE C1	AnimationID AnimationInstance X Y			
	ASCII	þÁ	AnimationID AnimationInstance X Y			
Define a region of the screen to be used for the specified animation. If an animation is already in use at that index, it						
will be overwritten. Multiple Animation Instances can be setup from one buffered animation file. Use the start						
animation command to display and play an animation instance.						
AnimationID	Byte	Index where an animation file has been loaded.				

AnimationID	Byte	Index where an animation file has been loaded.
AnimationInstance	Byte	Index used to identify this animation instance in the animation list.
X	Signed Short	Leftmost coordinate.
Υ	Signed Short	Topmost coordinate.

8.2 Start/Stop Animation	Dec	254 194	AnimationInstance State 2.0		
	Нех	FE C2	AnimationInstance State		
	ASCII	þÂ	AnimationInstance State		
Start or stop an animation instan	Start or stop an animation instance. After it is started, an animation will loop until stopped.				
AnimationInstance	Byte	Index used to identi	fy this animation instance in the animation list.		
State	Byte Desired animation state, as per eAnimationState Values.				

Table 34: eAnimationState Values

0	Paused
1	Playing

8.3 Set Animation Frame	Dec	254 195	AnimationInstance Frame	2.0
	Hex	FE C3	AnimationInstance Frame	
	ASCII	þÃ	AnimationInstance Frame	
Set the current frame of a displayed animation. If the frame exceeds the total number present, the animation will be				
set to the first frame.				
AnimationInstance	Byte	Index used to identi	fy this animation instance in the anim	nation list.
Frame	Byte	Number of the frame to be displayed.		

8.4 Get Animation Frame	Dec Hex	254 196 FF C4	AnimationInstance AnimationInstance	2.0
	ASCII		AnimationInstance	
Get the current frame of an existing animation instance.				
AnimationInstance	Byte	Index used to ident	ify this animation instance in the ani	imation list.
Return Message	252 196 Length	Frame		
Frame	Byte	Current state of the playing, 6 for invalid	specified animation frame; 0 for pad index.	used, 1 for

8.5 Stop All Animations	Dec	254 198	2.0
	Hex	FE C6	
	ASCII	þÆ	
Stop all currently running animation instances at their present frame.			

8.6 Clear Animation	Dec	254 199	AnimationInstance	2.0
	Нех	FE C7	AnimationInstance	
	ASCII	þÇ	AnimationInstance	
Stop the specified animation instance at the current frame and remove it from the animation list. The animation				
image data will remain loaded in the animation buffer and can be reused by issuing the setup command.				
AnimationInstance	Byte	Index used to ident	ify this animation instand	ce in the animation
		list.		

8.7 Clear All Animations	Dec	254 200	2.0
	Нех	FE C8	
	ASCII	þÈ	

Stop all animation instances at their current frames and remove them from the animation list. The animation image data will remain loaded in animation buffers and can be reused by issuing the setup command.

8.8 Resume All Animations	Dec	254 201	2.0
	Hex	FE C9	
	ASCII	þÉ	

Resume all stopped animation instances from their present frame.

2.9 Graphs

9.1 List All Bargraphs	Dec	254 102	2.		
	Hex	FE 66	0		
	ASCII	þf			
Get the current state, type, and	Get the current state, type, and value of all 256 bargraphs in the bargraph list. Three bytes per entry indicate				
current display use, type, and cu	ırrent value.				
Return Message	252 102 Length	BarType BarValue			
BarType	Byte	Type of bargraph entry.			
BarValue	Signed Short	Current value of bargraph entry.			

Table 35: eBargraphType Values

Value	Description
0	Unused
1	Plain
2	NineSlice

9.2 Define a	Dec	254 103	BarlD Min Max X Y Width Height FGR FGG FGB BGR BGG BGB D	2.0
Plain	Hex	FE 67	BarlD Min Max X Y Width Height FGR FGG FGB BGR BGG BGB D	
Bargraph	ASCII	þg	BarlD Min Max X Y Width Height FGR FGG FGB BGR BGG BGB D	

Define a new plain bargraph. Upon execution of an update command, the bargraph are will be filled with the background colour, then a bar will be drawn to the current value using the foreground colour. New index definitions will overwrite old, invalid directions will default to 0, and inverted min and max values will be automatically corrected.

BarID	Byte	Index used to identify this bargraph in the bargraph list.
Min	Signed Short	Minimum bargraph value.
Max	Signed Short	Maximum bargraph value.
X	Signed Short	Leftmost coordinate of the bargraph.
Υ	Signed Short	Topmost coordinate of the bargraph.
Width	Signed Short	Width of the bargraph.
Height	Signed Short	Height of the bargraph.
FGR	Byte	Red component of the foreground colour.
FGG	Byte	Green component of the foreground colour.
FGB	Byte	Blue component of the foreground colour.
BGR	Byte	Red component of the background colour.
BGG	Byte	Green component of the background colour.
BGB	Byte	Blue component of the background colour.
D	Byte	Direction that the bargraph will take, as per eBargraphOrientation Values.

Table 36: eBargraphOrientation Values

9.3 Define	Dec	254 104	BarID Min Max X Y Width Height BFG BBG D	2.0				
a 9-Slice	Hex	FE 68	BarID Min Max X Y Width Height BFG BBG D					
Bargraph	ASCII	þh	BarID Min Max X Y Width Height BFG BBG D					
Define a nev	v 9-slice bargraph	. Upon ex	ecution of an update command, the bargraph region will be filled with the					
background	9-slice, then a bar	will be d	rawn to the current value using the foreground 9-slice. New index definition	ns				
will overwrit	te old, invalid dire	ctions wil	default to 0, and inverted min and max values will be automatically correc	ted.				
BarlD	Byte	Index us	ed to identify this bargraph in the bargraph list.					
Min	Signed Short	Minimu	inimum bargraph value.					
Max	Signed Short	Maximu	ximum bargraph value.					
X	Signed Short	Leftmos	t coordinate of the bargraph.					
Υ	Signed Short	Topmos	t coordinate of the bargraph.					
Width	Signed Short	Width o	f the bargraph.					
Height	Signed Short	Height o	of the bargraph.					
BFG	Byte	9-Slice b	uffer index of the foreground image.					
BBG	Byte	9-Slice b	uffer index of the background image.					
D	Byte	Directio	n that the bargraph will take, as per eBargraphOrientation Values.					

9.4 Update a Bargraph	Dec	254 105	BarID Value	2.0
Value	Hex	FE 69	BarID Value	
	ASCII	þi	BarID Value	
Update the value of an ex	Update the value of an existing bargraph. Value will be bounded to the bargraph minimum and maximum.			
BarlD	Byte	Index used to ident	ify this bargraph in the bargraph list.	
Value	Signed Short	Current value of the	e bargraph.	
Return Message	252 105 Length	Result		
Result	Byte	Outcome of Update eStatusCode Values	a Bargraph Value command, as per	

9.5 Update Multiple	Dec	254 106	BarID Length Values	2.0
Bargraph Values	Hex	FE 6A	BarID Length Values	
	ASCII	þj	BarID Length Values	
Update the values of mu	Itiple existing bargraphs.	Values will be bounded	to each bargraph minimum an	d
maximum.				
BarlD	Byte	Index used to ident	ify the first bargraph to be upd	lated in
		the bargraph list.		
Length	Byte	Length of the data t	to be transferred, in bytes.	
Values	Signed Short(s)	Current values, one	for each bargraph index to be	updated.
Return Message	252 106 Length	Result		
Result	Byte	Outcome of Set Mu	ltiple Bargraph Values comma	nd, as per
		eStatusCode Values		

9.6 Clear All Bargraphs	Dec	254 107	2.0
	Hex	FE 6B	
	ASCII	þk	

Clear all data from the bargraph list. This command erases all attributes and sets all bargraphs to an unused state, but does not affect the screen visually.

9.7 Reset a Trace Value	Dec	254 109	TraceID	2.1
	Hex	FE 6D	TraceID	
	ASCII	þ m	TraceID	
Clear all visual data from a trace, and reset its value. As a result, the next Update Trace command behaves as				
though it is the very first update after initialization.				
TraceID	Byte	Index used to identi	ify this trace in the trace list.	

9.8 Reset Multiple Trace Values	Dec	254 110	TraceID Number	2.1		
	Нех	FE 6E	TraceID Number			
	ASCII	þn	TraceID Number			
Clear all visual data from multiple	Clear all visual data from multiple traces, and reset their values. As a result, the next Update Trace commands					
behave as though they are the ve	behave as though they are the very first updates after initialization.					
TraceID	Byte Index used to identify the first trace to be reset in the trace list.					
Number	Byte	Byte Number of trace entries to be reset.				

9.9 List All Traces	Dec	254 115	2.1
	Hex	FE 73	
	ASCII	þs	
Get the current state and value of all 256 traces in the trace list.			
Return Message	252 115 Length	TraceID Value	
TraceID	Byte	Trace index number. One for each entry. 0 signifies an undefined entry.	
Value	Signed Short	Current value of the trace. One for each entry.	

9.10 Initialize	Dec	254 116	TraceID X Y Width Height Min Max Step Style Red Green Blue	2.1
a Trace	Hex	FE 74	TraceID X Y Width Height Min Max Step Style Red Green Blue	
	ASCII	þt	TraceID X Y Width Height Min Max Step Style Red Green Blue	
Initialize a new	graph trace. Upo	on execution c	f an update command, the trace region will be shifted by the step s	ize,
and a line or ba	r drawn betweer	the previous	value and the new one. A multi-trace graph can be created by	
initializing trace	s with the same	area, step, and	d style. Multi-trace graphs can be updated with the Update Multipl	e
Traces comman	d, individual trac	es can be upd	ated with the Update a Trace command.	
TraceID	Byte	Index used t	o identify this trace in the trace list.	
X	Signed Short	Leftmost cod	ordinate of the trace region.	
Υ	Signed Short	Topmost cod	ordinate of the trace region.	
Width	Signed Short	Width of the	trace region.	
Height	Signed Short	Height of the	e trace region.	
Min	Signed Short	Value displa	yed at the lowest point of the trace.	
D. 0	C'	\	and an also bright and an electric field and an	

Max **Signed Short** Value displayed at the highest point of the trace. Step Byte Number of pixels shifted when a trace is updated. Style Byte Orientation and Direction of the trace, as per eTraceTypeandDirection Values. A style is created by summing values of individual attributes. For example, a Line with a Bottom Left origin, Shifting right has a Style value of 129. Red Byte Intensity of red for trace colour, 0 to 255, limited to display metrics. Intensity of green for trace colour, 0 to 255, limited to display metrics. Green Byte Blue Intensity of blue for trace colour, 0 to 255, limited to display metrics. **Byte**

Table 37: eTraceTypeandDirection Values

Value	Description
0	Bar
1	Line
2	Step
3	Box
0	BottomLeft
0	ShiftTowardOrigin
16	LeftUp

64	BottomRight
128	ShiftAwayFromOrigin
80	LeftDown
96	TopLeft
112	RightUp

9.11 Update a Trace	Dec	254 117	TraceID Value	2.1
	Hex	FE 75	TraceID Value	
	ASCII	þu	TraceID Value	
Update the value of the trace at the specified index. Trace will be bounded to the minimum and maximum.				
TraceID	Byte	Index used to ident	ify this trace in the trace list.	
Value	Signed Short	Current value of the	e specified trace.	

9.12 Update Multiple Traces	Dec Hex ASCII	FE 76	TraceID Length Values TraceID Length Values TraceID Length Values	2.1
Simultaneously update the value	s of the specified tra			
TraceID	Byte	Index used to identitrace list.	fy the first trace to be updated in the	<u>)</u>
Length	Byte	Length of the data t	o be transferred, in bytes.	
Values	Signed Short(s)	Current values, one updated.	for each of the trace index to be	
Return Message	252 118 Length	Result		
Result	Byte	Outcome of Update eStatusCode Values	Multiple Traces command, as per	

9.13 Clear All Traces	Dec	254 119	2.1
	Hex	FE 77	
	ASCII	þw	

Clear all data from the trace list. This command erases all attributes and sets all traces to an unused state, but does not affect the screen visually.

9.14 Set Trace Min and Max	Dec	254 148	TraceID Min Max	2.2
Values	Hex	FE 94	TraceID Min Max	
	ASCII	þ "	TraceID Min Max	
Update the min and max values of	of the specified tra	ace. Trace will visually	y update to new bounds.	
TraceID	Byte	Index used to identi Traces.	ify the previously defined tra	ace. Specific to
Min	Signed Short	The new minimum variety.	value for the trace as specifi	ed by
Max	Signed Short	The new maximum TraceIndex.	value for the trace as specifi	ied by

9.15 Get Trace Min and Max	Dec	254 149	TraceID	2.2	
Values	Hex	FE 95	TraceID		
	ASCII	þ •	TraceID		
Get the current min and max values of the specified trace.					
TraceID	Byte	Index used to identify the previously defined trace. Specific			
		to Traces.			
Return Message	252 149 Length	Min Max			
Min	Signed Short	The min value of the trace specified.			
Max	Signed Short	The max value o	The max value of the trace specified.		

2.10 Keypad

10.1 Clear Key Buffer	Dec	254 69	2.0
	Hex	FE 45	
	ASCII	þЕ	

Clear all saved key presses from the key buffer.

10.2 Clear a Scripted Key	Dec	254 70	Row Column 2.6		
	Hex	FE 46	Row Column		
	ASCII	þF	Row Column		
Clear the script attached to the specified scripted key. While this key will continue to report its value, any attached scripts will no longer execute.					
Row	Byte	Row index of the s	scripted key to be cleared.		
Column	Byte	Column index of tl	he scripted key to be cleared.		

10.3 Clear All Scripted Keys	Dec	254 71	2.6
	Hex	FE 47	
	ASCII	þG	

Clear the scripts attached to all scripted keys. While keys will continue to report their value, any attached scripts will no longer execute.

10.4 Set Keypad Transmit Mode	Dec	254 79	AutoTransmit	2.0			
	Hex	FE 4F	AutoTransmit				
	ASCII	þΟ	AutoTransmit				
Toggle auto transmission of key values. Can be used to poll the key buffer.							
AutoTransmit	Byte	Auto transmit mod	de, as per eOnOff Values				

Table 38: eOnOff Values

Value	Description
0	Off
1	On

10.5 Set Debounce Time	Dec	254 85	Mode 2.0		
	Hex	FE 55	Mode		
	ASCII	þυ	Mode		
Set the time, in ms, between a key press and a key read by the display. Most switches will bounce when pressed; the debounce time allows the switch to settle for an accurate read. Default is 64ms.					

Mode Byte Debounce time in milliseconds.

10.6 Set Keypad Backlight Time	Dec	254 151 Minutes
	Hex	FE 97 Minutes
	ASCII	þ — Minutes
Set the keypad backlight on for a	specified length	of time. This is a GTT29A command only.
Minutes	•	Number of minutes to leave the keypad backlight on. Send 0 to keep the keypad backlight on indefinitely.
10.7 Get Keypad Backlight Time	Dec	254 152
	Hex	FE 98
	ASCII	þ~
Get the current keypad backlight	on time. This is	a GTT29A command only.
Return Message	252 152 Lengtl	h Minutes
Minutes	Byte	Number of minutes to leave the keypad backlight on.
10.8 Set Keypad Brightness	Dec	254 155 Brightness
	Hex	FE 9B Brightness
	ASCII	b > Brightness
Set the keypad backlight brightne	ess. This is a GTT	29A command only.
Brightness	-	Keypad brightness, a value between 0 (off) and 255 (maximum) Default is 255.
		32000000
40.0 C-t K D-i-l-t	D	254.450
10.9 Get Keypad Brightness	Dec	254 156
	Hex	FE 9C
	ASCII	þ œ
Get the keypad backlight brightness		
Return Message	252 156 Lengtl	
Brightness	Byte	The current keypad brightness setting.
10.10 Set Auto Backlight	Dec	254 157 Setting
	Нех	FE 9D Setting
	ASCII	þ • Setting
Set the way in which the keypad	backlight respon	ds when a key is pressed. This is a GTT29A command only.
Setting	Byte A	Auto Backlight setting, as per eAutoBacklight Values.

Table 39: eAutoBacklight Values

Value	Description
0	TransmitKeyNoLightChange
1	TransmitKeyLightBacklight
8	OmitKeyNoLightChange
9	OmitKeyLightBacklight

10.11 Set Typematic Interval	Dec	254 158	Interval	2.0		
	Hex	FE 9E	Interval			
	ASCII	þž	Interval			
Set the interval between reported key presses when a key is held and the display is in typematic mode.						
Interval	Short Time between key reports, in ms, default is 200ms.					

10.12 Set Typematic Delay	Dec	254 159	Delay	2.0			
	Hex	FE 9F	Delay				
	ASCII	þΫ	Delay				
Set the delay between the first ke	Set the delay between the first key press and first typematic report when a key is held in typematic mode.						
Delay	Short	Time key must be h is 1000ms.	eld to trigger ty	pematic reports, in ms, default			

10.13 Set Auto Repeat Mode	Dec	254 165	Mode	2.0		
	Hex	FE A5	Mode			
	ASCII	þ¥	Mode			
Set key press repeat mode to typematic or hold. In typematic mode if a key press is held, by default the key value is transmitted immediately, then 5 times a second after a 1 second delay. In hold mode, the key down value is						

transmitted once when pressed, and then the key up value is sent when the key is released. Default is typematic.

Mode

Byte

Desired keypad auto repeat mode, as per eKeypadRepeatMode Values.

Table 40: eKeypadRepeatMode Values

Value	Description
0	Off
1	Hold
2	Typematic

10.14 Assign Keypad	Dec	254 213	Length KeyCodes
Codes	Hex	FE D5	Length KeyCodes
	ASCII	þÕ	Length KeyCodes
Assign the values sent to th	e host when	a key press is dete	ected. Up to 25 keys may be defined.
Length	Byte	Length of the da	ta to be transferred, in bytes.
KeyCodes	Byte(s)	A list of byte value through 90.	ues for each key to be defined. Default values are 65

2.11 Touch

11.1 Create a	Dec	254 132	RegionID X Y Width Height Up Down	2.0		
Touch Region	Hex	FE 84	RegionID X Y Width Height Up Down			
	ASCII	þ "	RegionID X Y Width Height Up Down			
Create a region of th	e screen that res	ponds to touch	events with a unique message and momentary visual upda	ite.		
RegionID	Byte	Index used to	dentify this touch region in the touch region list. Region 2	255		
		is reserved for out of region responses.				
X	Signed Short Leftmost coordinate of the touch region.					
Υ	Signed Short Topmost coordinate of the touch region.					
Width	Short	Width of the touch region.				
Height	Short	Height of the touch region.				
Up	Byte	yte Index of the loaded bitmap displayed when the region is released.				
Down	Byte	Index of the lo	aded bitmap displayed when the region is touched.			

11.2 Clear a Touch Region	Dec	254 133	RegionID	2.0			
	Hex	FE 85	RegionID				
	ASCII	þ	RegionID				
Clear the specified touch region from the touch region list. This ensures touch events will no longer be reported							
from this region.							
RegionID	Byte	Index used to identi	ify this touch re	gion in the touch region list.			

11.3 Clear All Touch Regions	Dec	254 134	2.0
	Hex	FE 86	
	ASCII	þ†	

Clear all touch regions from the screen and memory, ensuring their touch events will no longer be reported.

11.4 Change Touch Reporting	Dec	254 135	ReportingType	2.0
Style	Hex	FE 87	ReportingType	
	ASCII	þ ‡	ReportingType	
Customize the way in which tou	ch events are r	eported. Default is Re	gionDown.	
ReportingType	Byte	Desired touch repor	rting style, as per eTouchReportingTy	pe
		Values.		

Table 41: eTouchReportingType Values

Value	Description	Value	Description
0	RegionNone	8	CoordNone
1	RegionDown	9	CoordDown
2	RegionUp	10	CoordUp
3	RegionUpDown	11	CoordUpDown
4	RegionMove	12	CoordMove
5	RegionMoveDown	13	CoordMoveDown
6	RegionMoveUp	14	CoordMoveUp
7	RegionMoveUpDown	15	CoordMoveUpDown

11.5 Get Touch Reporting Style	Dec 254 136	2.0
	Hex FE 88	
	ASCII þ ^	

Get the current touch reporting style.

Return Message	252 136 Length	Result ReportingType
Result	Byte	Outcome of Get Touch Reporting Style command, as per eStatusCode Values.
ReportingType	Byte	Current touch reporting style, as per eTouchReportingType Values.

11.6 Set Dragging Threshold	Dec	254 137	Threshold	•	2.0
	Hex	FE 89	Threshold		
	ASCII	þ ‰	Threshold		
C tall It to the state of the s	1				

Set the distance a press is required to travel before a move event is reported. Precision will vary inversely to data transmitted; care should be taken to find a suitable balance. Distance is calculated as $[\Delta x]^2 + [\Delta y]^2 = d^2$.

Threshold Short Dragging threshold value. Default is 3 pixe	els.
---	------

11.7 Calibrate Touch Screen	Dec	254 139	2.0
	Hex	FE 8B	
	ASCII	þ ‹	

Initiate the touch screen calibration sequence, after user input is complete a confirmation byte will be returned, new calibration settings will be loaded, and the calibration will be saved as \SYSTEM\touchcal.dat. Calibration can be restored from the file at any time.

Return Message	252 139 Length Result	
Result	Byte	Outcome of Calibrate Touch Screen command, as per
		eCalibrationErrorCode Values.

Table 42: eCalibrationErrorCode Values

Value	Description
1	CalibrationSuccessful
12	CalibrationInvalid

11.8 Load Region File	Dec	254 140	FileName	2.0
	Hex	FE 8C	FileName	
	ASCII	þŒ	FileName	
Load a group of touch region definitions from a file. If an existing region exists with the same index as a region			in	
the file, it will be overwritten. See	the Region File exa	ample.		
FileName	ASCII String	Filename, and path	from the root folder, of the region fi	e to
		load.		
Return Message	252 140 Length	Result		
Result	Byte	Outcome of Load Re	egion File command, as per eStatusC	ode

Values.

11.9 Restore Touch Calibration	Dec	254 141	2.0
	Hex	FE 8D	
	ASCII	þ •	
Postore touch calibration using the data from \CVCTEM\toucheal dat if this file is present			

Restore touch calibration using the data from \SYSTEM\touchcal.dat, if this file is present.

Byte

Setting

Return Message	252 141 Length	Result
Result	Byte	Outcome of Restore Touch Calibration command, as per
		eRestoreCalibrationErrorCode Values.

Table 43: eRestoreCalibrationErrorCode Values

Value	Description	
0	RestoreCalibrationInvalid	
1	RestoreCalibrationSuccessful	

11.10 Set Out of Region Setting	Dec	254 142	Setting	2.0
	Hex	FE 8E	Setting	
	ASCII	þŽ	Setting	
Set whether out of region respon	ses will be returned o	r not. Out of	region responses are returned when a tou	ch
occurs outside a region, while in a	region mode. The ind	ex of an out o	f region response is 255.	

Desired out of region setting, as per eOnOff Values. Default is Off.

11.11 Get Out of Region Setting	Dec	254 143	2.0
	Hex	FE 8F	
	ASCII	þ •	
Get the current out of region sett	ing.		
Return Message	252 143 Length	Report	
Report	Byte	Current out of region setting, as per eOnOff Values.	

11.12 Set Region Activate State	Dec	254 146	RegionID Enable	2.2
	Hex	FE 92	RegionID Enable	
	ASCII	þ ′	RegionID Enable	
Set the activation state for a spec	ific region. Useful f	for temporarily	disabling a region. W	hen a region is created,
the default is activated.				
RegionID	Byte	Index used to	o identify the touch re	gion in the touch region

Enable	Byte	Activation state, as per eEnable Values.
Return Message	252 146 Length	Result
Result	Byte	Outcome of Set Region Activation State command, as per
		eStatusCode Values.

11.13 Get Region Activate State	Dec	254 147	RegionID	2.2	
	Hex	FE 93	RegionID		
	ASCII	þ "	RegionID		
Get the current activation state of a specific region. An invalid touch region error will be returned if the specified index does not exist in the touch region list.					
RegionID	Byte	Index used t	o identify the touch region in th	ne touch region	
		list.			
Return Message	252 147 Length	Enable			
Enable	Byte	Current regi	on activation state, as per eEna	ble Values.	

11.14 Create a	Dec	254 150 RegionID X Y Width Height OffID OnID 2.4
Toggle Region	Hex	FE 96 RegionID X Y Width Height OffID OnID
	ASCII	þ – RegionID X Y Width Height OffID OnID
Create a region of t	he screen that respo	onds to touch events with a unique message and toggleable visual update.
RegionID	Byte	Index used to identify this toggle region in the touch region list. Region
		255 is reserved for out of region responses.
X	Signed Short	Leftmost coordinate of the toggle region.
Υ	Signed Short	Topmost coordinate of the toggle region.
Width	Short	Width of the toggle region.
Height	Short	Height of the toggle region.
OffID	Byte	Index of the loaded bitmap displayed when the region is in an inactive
		state.
OnID	Byte	Index of the loaded bitmap displayed when the region is in a toggled
		state.
Return Message	252 150 Length	Result
Result	Byte	Outcome of the Create Toggle Region command, as per eStatusCode
		Values.

11.15 Create	Dec 254 161	. RegionID X Y LT RB TrkWidth TrkHeight BtnWidth BtnHeight TrkID BtnID Style 2.4
a Slider	Hex FE A1	. RegionID X Y LT RB TrkWidth TrkHeight BtnWidth BtnHeight TrkID BtnID Style
	ASCII þi	RegionID X Y LT RB TrkWidth TrkHeight BtnWidth BtnHeight TrkID BtnID Style
Create a regio	n of the screen that	displays a slider control and responds to touch events with a unique message including its
current value,	as well as a matchin	ng visual update.
RegionID	Byte	Index used to identify this slider in the touch region list. Region 255 is reserved for out of
		region responses.
X	Signed Short	Leftmost coordinate of the slider region.
Υ	Signed Short	Topmost coordinate of the slider region.
LT	Signed Short	Leftmost/Topmost value returned by the slider region. This is the default initial button
		location.
RB	Signed Short	Rightmost/Bottommost value returned by the slider region.
TrkWidth	Short	Width of the slider track region.
TrkHeight	Short	Height of the slider track region.
BtnWidth	Short	Width of the slider button region.
BtnHeight	Short	Height of the slider button region.
TrkID	Byte	Index of the loaded 9-slice file displayed within the track region.
BtnID	Byte	Index of the loaded 9-slice file displayed within the button region.
Style	Byte	Style of the slider, as per eSliderStyles Values.
Return	252 161 Length	Result
Message		
Result	Byte	Outcome of the Create Slider command, as per eStatusCode Values.

		RegionID X Y LT RB TrkWidth TrkHeight BtnWidth BtnHeight TrkID FilID BtnID
		Style
_	n of the screen that	displays a filled slider control and returns touch events.
RegionID	Byte	Index used to identify this filled slider in the touch region list. Region 255 is reserved for out
		of region responses.
X	Signed Short	Leftmost coordinate of the filled slider region.
Υ	Signed Short	Topmost coordinate of the filled slider region.
LT	Signed Short	Leftmost/Topmost value returned by the filled slider region. This is the default initial button
		location.
RB	Signed Short	Rightmost/Bottommost value returned by the filled slider region. Invert LT/RB values to
		swap the location of the fill.
TrkWidth	Short	Width of the slider track region.
TrkHeight	Short	Height of the slider track region.
BtnWidth	Short	Width of the slider button region.
BtnHeight	Short	Height of the slider button region.
TrkID	Byte	Index of the loaded 9-slice file displayed within the empty track region.
FillD	Byte	Index of the loaded 9-slice file displayed within the filled track region.
BtnID	Byte	Index of the loaded 9-slice file displayed within the button region.
Style	Byte	Style of the slider, as per eSliderStyles Values.
Return	252 163 Length	Result
Message		
Result	Byte	Outcome of the Create Slider command, as per eStatusCode Values.

11.17 Set Slider Value	Dec	254 166	RegionID Value	2.4
	Hex	FE A6	RegionID Value	
	ASCII	þ¦	RegionID Value	
Set the value of a previously crea	ted slider. Useful fo	or setting the initial sli	der position.	
RegionID	Byte	Index used to identi	fy the slider in the touch region list.	
Value	Signed Short	Desired value for th	e specified slider.	
Return Message	252 166 Length	Result		
Result	Byte	Outcome of the Set Slider Value command, as per eStatusCode Values.		

11.18 Get Slider Value	Dec	254 167	RegionID	2.4
	Hex	FE A7	RegionID	
	ASCII	þ§	RegionID	
Get the current value of an existing	ng slider.			
RegionID	Byte	Index used to identify the slider in the touch region list.		
Return Message	252 167 Length	Result Value		
Result	Byte	Outcome of the Get Slider Value command, as per eStatusCode Values.		
Value	Signed Short	Current value of the	e specified slider.	

11.19 Set Toggle State	Dec Hex ASCII	254 170 FE AA þ ª	RegionID State RegionID State RegionID State	2.5
Set the state of a previously creatoggleable output object.	ted toggle region. U	Jsed for setting the in	itial toggle position, or controlling a	
RegionID	Byte	Index used to identillist.	fy the toggle region in the touch regi	on
State	Byte	Desired state for the	e specified toggle region.	
Return Message	252 170 Length	Result		
Result	Byte	Outcome of the Set eStatusCode Values	Toggle State command, as per	

11.20 Get Toggle State	Dec Hex ASCII	254 171 FE AB þ «	RegionID RegionID RegionID	2.5
Get the state of a previously crea	nted toggle region.			
RegionID	Byte	Index used to identify the toggle region in the touch region		
		list.		
Return Message	252 171 Length	Result State		
Result	Byte	Outcome of the Get Toggle State command, as per		
		eStatusCode Values		
State	Byte	Current state of the specified toggle region.		

2.12 Output

<u> </u>					
12.1 Set GPO State	Dec	254 73	Number Setting	2.0	
	Hex	FE 49	Number Setting		
	ASCII	þΙ	Number Setting		
Toggle the specified General Purpose Output pin on or off, sourcing up to 15mA current at 5V per GPO or sinking					
to ground. This command can be used to control devices, or signal a host device.					
Number	Byte	GPO to be controlled.			
Setting	Byte	GPO state, as per	eGPOSetting Values.		

Table 45: eGPOSetting Values

Value	Description
1	On
0	Off

12.2 Set LED Indicator State	Dec	254 74	Number State	2.6
	Hex	FE 4A	Number State	
	ASCII	þJ	Number State	
Immediately sets the state of the specified LED indicator to a specific colour. This is a GTT29A command only.				
Number	Byte	Number of the LEI	O Indicator to be set.	
State	Byte	Desired Indicator	State, as per eIndicatorState Values.	

Table 46: eIndicatorState Values

Value	Description
0	Off
1	Green
2	Red
3	Yellow

12.3 Activate Motor	Dec	254 160	Frequency Duration	2.0	
	Hex	FE A0	Frequency Duration		
	ASCII	þ	Frequency Duration		
Activate a vibratory pulse from the motor at the specified frequency for the defined duration.					
Frequency	Short	Frequency of the vil	oration in Hertz.		
Duration	Short Duration of the vibration in milliseconds.				

12.4 Set Input Feedback	Dec Hex ASCII	254 182 FE B6 þ ¶	InputOutputType DownFrequency UpFrequency InputOutputType DownFrequency UpFrequency InputOutputType DownFrequency UpFrequency	2.0	
Initiate autonomous feedback by specifying a 50ms output event for specific input events.					
InputOutputType	Byte	Desired input event and output response types, as per eKeypadInputOutputType Values. Multiple events and/or responses can be selected by summing values.			
DownFrequency	Short	Frequency of the down event in Hertz.			
UpFrequency	Short	Frequency o	f the up event in Hertz.		

Table 47: eKeypadInputOutputType Values

Value	Description
0	None
1	OutputBeep
2	OutputMotor
4	InputKeypad
8	InputTouch

12.5 Activate Buzzer and Motor	Dec	254 183	Frequency Duration	2.1	
	Hex	FE B7	Frequency Duration		
	ASCII	þ·	Frequency Duration		
Activate both a vibratory pulse from the motor and a tone from the piezo buzzer simultaneously, at the specified					
frequency for the defined interval.					
Frequency	Short	Frequency of the be	eep and vibration in Hert	Z.	
Duration	Short Duration of the beep in milliseconds.				

12.6 Activate Buzzer	Dec	254 187	Frequency Duration	2.0	
	Нех	FE BB	Frequency Duration		
	ASCII	þ»	Frequency Duration		
Activate a tone from the piezo buzzer at the specified frequency for the defined duration.					
Frequency	Short	Frequency of the be	eep in Hertz.		
Duration	Short	Short Duration of the beep in milliseconds.			

12.7 Set Default Buzzer Beep	Dec	254 188	Frequency Duration	2.0	
	Hex	FE BC	Frequency Duration		
	ASCII	þ ¼	Frequency Duration		
Set the frequency and duration of the default beep transmitted when the bell character is transmitted.					
Frequency	Short	Frequency of the be	eep in Hertz.		
Duration	Short	Duration of the beep in milliseconds.			

2.13 Scripts

13.1 Run Script File	Dec 254 93	FileName	2.0
	Hex FE 5D	FileName	
	ASCII þ]	FileName	

Run a script file from the GTT SD card. This command will process an array of bytes from a script file as if it was received from the serial port. Sending data to the serial port is still possible, but it will queue up in the input buffer and will only be parsed after the execution of the script file. Scripts may be stacked up to 10 deep.

FileName ASCII String Filename, and path from the root folder, of the script file to run.

13.2 Create a	Dec	254 131	RegionID X Y W H UpBitmap DownBitmap UpScript DownScript	2.1
Scripted	Hex	FE 83	RegionID X Y W H UpBitmap DownBitmap UpScript DownScript	
Region	ASCII	þf	RegionID X Y W H UpBitmap DownBitmap UpScript DownScript	

Create a region of the screen that responds to touch events with a unique message, momentary visual update, and script execution. Region value(s), depending on reporting style, will be reported before scripts execute. Scripts will always execute, regardless of the current touch reporting style. If one of the scripts is not desired, use an empty string for its filename.

RegionID	Byte	Index used to identify this scripted region in the touch region list. Region 255 is reserved for out of region responses.		
X	Signed Short	Leftmost coordinate of the scripted touch region.		
Υ	Signed Short	Topmost coordinate of the scripted touch region.		
W	Short	Width of the scripted touch region.		
Н	Short	Height of the scripted touch region.		
UpBitmap	Byte	Index of the loaded bitmap displayed when the region is released.		
DownBitmap	Byte	Index of the loaded bitmap displayed when the region is pressed.		
UpScript	ASCII String	Filename of the script to be executed when the region is released.		
DownScript	ASCII String	Filename of the script to be executed when the region is pressed.		

13.3 Create a	Dec 254 138	KeyID Row Col UpScript DownScript	2.1
Scripted Key	Hex FE 8A	KeyID Row Col UpScript DownScript	
	ASCII þŠ	KeyID Row Col UpScript DownScript	

Link the execution of a script file to a key at specific hardware row and column. Key value(s), depending on reporting style, will be reported before scripts execute. Scripts always execute, regardless of the current key reporting style. If one of the scripts is not desired, use an empty string for its filename.

KeyID	Byte	Index used to identify this scripted key in the key list.
Row	Byte	Row index of the scripted key.
Col	Byte	Column index of the scripted key.
UpScript	ASCII String	Filename of the script to be executed when the key is released.
DownScript	ASCII String	Filename of the script to be executed when the key is pressed.

13.4 Create a	Dec	254 162	RegionID X Y Width Height OffID OnID OffScript OnScript	2.4
Scripted Toggle	Нех	FE A2	RegionID X Y Width Height OffID OnID OffScript OnScript	
Region	ASCII	þ¢	RegionID X Y Width Height OffID OnID OffScript OnScript	

Create a region of the screen that responds to touch events with a unique message, toggleable visual update, and script execution. Scripts will always execute, regardless of the current touch reporting style. If a script is not desired, use an empty string for its filename.

RegionID	Byte	Index used to identify this scripted toggle region in the touch region list.
		Region 255 is reserved for out of region responses.
X	Signed Short	Leftmost coordinate of the scripted toggle region.
Υ	Signed Short	Topmost coordinate of the scripted toggle region.
Width	Short	Width of the scripted toggle region.
Height	Short	Height of the scripted toggle region.
OffID	Byte	Index of the loaded bitmap displayed when the region is in an inactive state.
OnID	Byte	Index of the loaded bitmap displayed when the region is in a toggled state.
OffScript	ASCII String	Filename of the script to be executed when the region is first placed in an inactive state.
OnScript	ASCII String	Filename of the script to be executed when the region is first placed in a toggled state.
Return Message	252 162 Length	Result
Result	Byte	Outcome of the Create Scripted Toggle Region command, as per eStatusCode Values.

3 Appendix

3.1 Command Summary

Available commands below include identifying number, required parameters, the returned response and the response type.

Table 48: Communication Commands

Name	Dec	Hex	ASCII	Parameters	Response
Enter Mass Storage Mode	4	04	[EOT]	None	None
Set Communication Channel	5	05	[ENQ]	Channel	None
Set Baud Rate	57	39	9	BaudRate	None
Set Flow Control Mode	58	3A	:	FlowControl	None
Set I2C Address	247	F7	÷	12Caddress	None
Echo	255	FF	ÿ	Message	ReturnMessage

Table 49: Module Commands

Name	Dec	Hex	ASCII	Parameters	Response
Get Protocol Revision	0	00	[NUL]	None	Major, Minor
Reset Module	1	01	[SOH]	None	None
Delay	2	02	[STX]	Time	None
Get Display Metrics	3	03	[ETX]	None	Width, Height, BitsRed, BitsGreen, BitsBlue
Set Screen Orientation	50	32	2	Orientation	None
Set Customer Data	52	34	4	Length, Data	None
Get Customer Data	53	35	5	None	Length, Data
Get Module Type	55	37	7	None	Module
Get Module String	56	38	8	None	ModuleString
Set Backlight Brightness	153	99	тм	Brightness	None
Get Backlight Brightness	154	9A	š	None	Brightness
Write ScratchPad	204	CC	ì	Index, Length, Data	None
Read ScratchPad	205	CD	ĺ	Index, Size	Length, Result
Set Communication Flags	251	FB	û	Data	CRCStatus

Table 50: Drawing Commands

Name	Dec	Hex	ASCII	Parameters	Response
Set Background Drawing Colour	86	56	V	R, G, B	None
Get Background Drawing Colour	87	57	W	None	R, G, B
Clear Screen	88	58	Χ	None	None
Scroll Screen	89	59	Υ	X, Y, Width, Height, MoveX, MoveY	None
Enable Manual Update	90	5A	Z	Enable	None
Manual Update	91	5B	[None	None
Flush Region	92	5C	\	X, Y, Width, Height	None
Set Drawing Colour	99	63	С	R, G, B	None
Get Drawing Colour	100	64	d	None	R, G, B
Continue Line	101	65	е	Х, Ү	None
Draw Line	108	6C	1	X1, Y1, X2, Y2	None
Draw Pixel	112	70	р	X, Y	None
Draw Rectangle	114	72	r	X, Y, Width, Height	None
Draw Filled Rectangle	120	78	х	X, Y, Width, Height	None
Draw Circle	123	7B	{	X, Y, Radius	None
Draw Filled Circle	124	7C		X, Y, Radius	None
Draw an Ellipse	125	7D	}	X, Y, XRadius, YRadius	None
Draw a Filled Ellipse	126	7E	~	X, Y, XRadius, YRadius	None
Draw Rounded Rectangle	127	7F	•	X, Y, Width, Height, Radius	None
Draw Filled Rounded Rectangle	128	80	€	X, Y, Width, Height, Radius	None
Draw Triangle	129	81	•	X1, Y1, X2, Y2, X3, Y3	None
Draw Filled Triangle	130	82	,	X1, Y1, X2, Y2, X3, Y3	None

Table 56: Graphs Commands

Name	Dec	Hex	ASCII	Parameters	Response
List All Bargraphs	102	66	f	None	BarType, BarValue
Define a Plain Bargraph	103	67	g	BarlD, Min, Max, X, Y, Width, Height, FGR, FGG, FGB, BGR, BGG, BGB, D	None
Define a 9-Slice Bargraph	104	68	h	BarlD, Min, Max, X, Y, Width, Height, BFG, BBG, D	None
Update a Bargraph Value	105	69	i	BarID, Value	Result
Update Multiple Bargraph Values	106	6A	j	BarID, Values	Result
Clear All Bargraphs	107	6B	k	None	None
Reset a Trace Value	109	6D	m	TraceID	None
Reset Multiple Trace Values	110	6E	n	TraceID, Number	None
List All Traces	115	73	S	None	TraceID, Value
Initialize a Trace	116	74	t	TraceID, X, Y, Width, Height, Min, Max, Step, Style, Red, Green, Blue	None
Update a Trace	117	75	u	TraceID, Value	None
Update Multiple Traces	118	76	V	TraceID, Values	Result
Clear All Traces	119	77	W	None	None
Set Trace Min and Max Values	148	94	"	TraceID, Min, Max	None
Get Trace Min and Max Values	149	95	•	TraceID	Min, Max

Table 57: Keypad Commands

Name	Dec	Hex	ASCII	Parameters	Response
Clear Key Buffer	69	45	Е	None	None
Clear a Scripted Key	70	46	F	Row, Column	None
Clear All Scripted Keys	71	47	G	None	None
Set Keypad Transmit Mode	79	4F	0	AutoTransmit	None
Set Debounce Time	85	55	U	Mode	None
Set Keypad Backlight Time	151	97	_	Minutes	None
Get Keypad Backlight Time	152	98	~	None	Minutes
Set Keypad Brightness	155	9B	>	Brightness	None
Get Keypad Brightness	156	9C	œ	None	Brightness
Set Auto Backlight	157	9D	•	Setting	None
Set Typematic Interval	158	9E	ž	Interval	None
Set Typematic Delay	159	9F	Ÿ	Delay	None
Set Auto Repeat Mode	165	A5	¥	Mode	None
Assign Keypad Codes	213	D5	Õ	Length, KeyCodes	None

Table 58: Touch Commands

Name	Dec	Hex	ASCII	Parameters	Response
Create a Touch Region	132	84	"	RegionID, X, Y, Width, Height, Up, Down	None
Clear a Touch Region	133	85		RegionID	None
Clear All Touch Regions	134	86	+	None	None
Change Touch Reporting Style	135	87	‡	ReportingType	None
Get Touch Reporting Style	136	88	^	None	Result, ReportingType
Set Dragging Threshold	137	89	‰	Threshold	None
Calibrate Touch Screen	139	8B	(None	Result
Load Region File	140	8C	Œ	FileName	Result
Restore Touch Calibration	141	8D	•	None	Result
Set Out of Region Setting	142	8E	Ž	Setting	None
Get Out of Region Setting	143	8F	•	None	Report
Set Region Activate State	146	92	,	RegionID, Enable	Result
Get Region Activate State	147	93	"	RegionID	Enable
Create a Toggle Region	150	96	-	RegionID, X, Y, Width, Height, OffID, OnID	Result
Create a Slider	161	A1	i	RegionID, X, Y, LT, RB, TrkWidth, TrkHeight, BtnWidth, BtnHeight, TrkID, BtnID, Style	Result
Create a Filled Slider	163	А3	£	RegionID, X, Y, LT, RB, TrkWidth, TrkHeight, BtnWidth, BtnHeight, TrkID, FilID, BtnID, Style	Result
Set Slider Value	166	A6	-	RegionID, Value	Result
Get Slider Value	167	Α7	§	RegionID	Result, Value
Set Toggle State	170	AA	<u>a</u>	RegionID, State	Result
Get Toggle State	171	AB	«	RegionID	Result, State

Table 59: Output Commands

Name	Dec	Hex	ASCII	Parameters	Response
Set GPO State	73	49	- 1	Number, Setting	None
Set LED Indicator State	74	4A	J	Number, State	None
Activate Motor	160	Α0		Frequency, Duration	None
Set Input Feedback	182	В6	¶	InputOutputType, DownFrequency, UpFrequency	None
Activate Buzzer and Motor	183	В7	•	Frequency, Duration	None
Activate Buzzer	187	BB	»	Frequency, Duration	None
Set Default Buzzer Beep	188	ВС	1/4	Frequency, Duration	None

Table 60: Scripts Commands

Name	Dec	Hex	ASCII	Parameters	Response
Run Script File	93	5D]	FileName	None
Create a Scripted Region	131	83	f	RegionID, X, Y, W, H, UpBitmap, DownBitmap, UpScript, DownScript	None
Create a Scripted Key	138	8A	Š	KeyID, Row, Col, UpScript, DownScript	None
Create a Scripted Toggle Region	162	A2	¢	RegionID, X, Y, Width, Height, OffID, OnID, OffScript, OnScript	Result

3.2 File Examples

9-Slices

The 9-Slice file format is a simple text file that describes how to take a bitmap, and slice it to scale nicely. An example file would be:

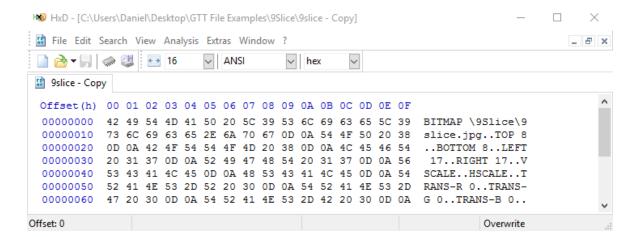

Figure 8: 9-Slice File Example

Each line must start with a keyword, followed by parameters. If a line contains an unrecognized keyword, the line is ignored. The following keywords are defined:

Table 61: 9-slice Keywords

Keyword	Parameters	Description
BITMAP	1	Following the keyword, the bitmap that will be sliced is specified
TOP	1	Specifies how many pixels will be used from the top, for the top slice
BOTTOM	1	Specifies how many pixels will be used from the bottom, for the bottom slice
LEFT	1	Specifies how many pixels will be used from the left, for the left slice
RIGHT	1	Specifies how many pixels will be used from the right, for the right slice
VSCALE	0	If this keyword is present, when the 9-Slice is resized it will stretch the middle left and middle right slices to fill the space required. Without this keyword present, the tile will be repeated from the top down to fill the space.
HSCALE	0	If this keyword is present, when the 9-Slice is resized it will stretch the middle top and middle bottom slices to fill the space required. Without this keyword present, the tile will be repeated from the left to right to fill the space.
TRANS-R	1	The red component of the colour to make transparent in the 9-Slice
TRANS-G	1	The green component of the colour to make transparent in the 9-Slice
TRANS-B	1	The blue component of the colour to make transparent in the 9-Slice

Animations

While the data for animations are stored in the buffer system outlined in the Buffers Section, the actual state of animations are stored in a separate series of animation buffers.

The animation descriptor file is a simple text file, with a series of lines of times to display a frame, and a bitmap to use for that frame. For example:

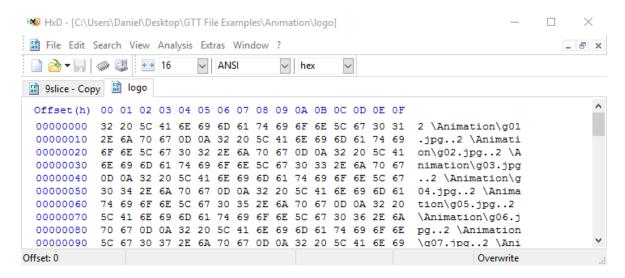

Figure 9: Animation File Example

The above example would define a simple animation with 4 frames. Frame 1 is displayed for 20ms, frame 2 is displayed for 2ms, frame 3 for 5ms, and frame 4 is displayed for 10ms. All file paths must be references with an absolute path from the root.

Region File

Region files can be created using any text editing software. Each line in a region file describes a single touch. There must be no leading blank spaces, only a single space between each field, and no trailing spaces. Bitmap buffers specified must be pre-loaded with desired images. An example of the first row of the calculator demo is shown below.

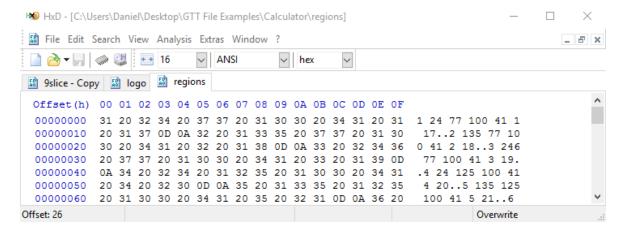

Figure 10: Region File Example

The file above would define four touch regions. The first has an index of 1 is positioned at coordinates (24, 77), a width of 100, and a height of 41. When it is pressed the bitmap in bitmap index 1 will be displayed, and when it is not pressed bitmap 17 will be displayed. Three similar regions follow this one.

Script

Scripts, similar to an AUTOEXEC, can be created by placing the binary stream of values that the module should execute when the script is called. The script below will clear the screen, set font color to blue, and write "Hello World" on the GTT.

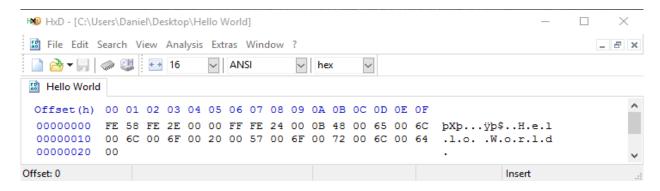

Figure 11: Script File Example

Please note, if a script executes, and a command is started within the script, however is not completed with the data in the script, the command will wait for data from the serial port to complete the command. After which, the module will return to normal operations.

Autoexec File

In order to create an autoexec file that will run on your GTT, simply place the binary stream of values that the module should execute on startup in the AUTOEXEC. The default autoexec file below, which ships from the factory, loads and displays a start screen before clearing the bitmap buffer.

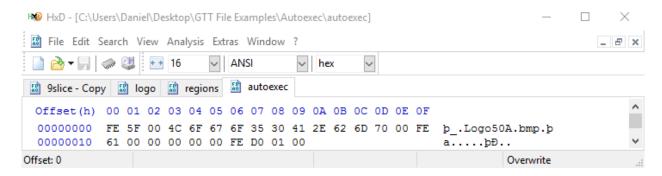

Figure 12: Autoexec File Example

Please note, if a command is started within the AUTOEXEC, however is not completed with the data in the AUTOEXEC, the command will wait for data from the serial port to complete the command. After which, the module will return to normal operations. The AUTOEXEC file is a special example of the script feature available on the GTT line.

3.3 Memory

Table 62: Valid Memory Card Types Table 63: Communication Buffe

9	Description	Size
ijjers	Table 64: RA	IVI Allocation

~2MB

30MB

Size	Туре	Buffer	Size	Description
128MB – 2GB	SD	Data buffer	4kB	Reserved RAM
4GB – 32GB	SDHC	FIFO queue	16 Byte	Buffers
64GB – 2TB	SDXC	Size	10 Byte	

^{*}Note: Despite generous buffer sizes, hardware flow control is recommended for all communication.

3.4 Data Types

Common Language Representations

The following table outlines native data types in common programming languages that can be used to represent the data types used in this manual.

Table 65: Data Types with Representations

	ANSI C/C++	C#	Visual Basic
Byte	unsigned char	byte	Byte
Signed Byte	signed char	Sbyte	SByte
Short	unsigned short	ushort	UShort
Signed Short	short	short	Short
Integer	unsigned int	uint	UInteger
Signed Integer	int	int	Integer
String	string	string	String

Table 66: Data Type Descriptions

Byte	Unsigned 8 bit data type that can represent a value from 0 to 255.
Signed Byte	Signed 8 bit data type that can represent a value from -128 to 127.
Short**	Unsigned 16 bit data type can represent values from 0 to 65,536.
Signed Short**	Signed 16 bit data type that can represent values from -32,768 to 32,767.
Integer **	Unsigned 32 bit data type that can represent values from 0 to 4,294,967,295.
Signed Integer**	Signed 32 bit data type that can represent values of -2,147,483,648 to 2,147,483.
String	Strings are a length of bytes terminated by a single null byte. The ASCII character set is used by default, but Unicode or UTF-8 strings may be used where specifically outlined.

^{**}Note: Transmission of multiple byte values can be set to either big or little endian order.

4 Definitions

9-Slice: Graphic format used to scale bitmaps, usually rectangular, without distorting their geometry. Nine regions define the object center, four corners, and four sides for accurate up or down scaling.

ASCII: American standard code for information interchange used to give standardized numeric codes to alphanumeric characters.

Big Endian: Transmission protocol whereby the most significant byte is transmitted first.

BPS: Bits per second, a measure of transmission speed.

GUI: Graphical user interface.

Hexadecimal: A base 16 number system utilizing symbols 0 through F to represent the values 0-15.

Inter-integrated circuit protocol uses clock and data lines to communicate short distances at slow speeds from a master to up to 128 addressable slave devices. A display is a slave device.

Little Endian: Transmission protocol whereby the least significant byte is transmitted first.

LSB: Least significant bit or byte in a transmission, the rightmost when read.

MSB: Most significant bit or byte in a transmission, the leftmost when read.

RS232: Recommended standard 232, a common serial protocol. A low level is -30V, a high is +30V.

RS422: Recommended standard 422, a more robust differential pair serial protocol.

SDA: Serial data line used to transfer data in I^2C protocol. This open drain line should be pulled high through a resistor. Nominal values are between 1K and 10K Ω .

SCL: Serial clock line used to designate data bits in I^2C protocol. This open drain line should be pulled high through a resistor. Nominal values are between 1K and 10K Ω .

TTL: Transistor-transistor logic applied to serial protocol. Low level is 0V while high logic is 5V.

TFT: Thin film transistor, used in reference to a crisp, full-colour LCD technology.

USB: Universal Serial Bus protocol widely used in PCs.
